TAKE THE BABY AND TAKE A PRIZE!

DON'T MISS THIS FASCINATING SECTION OF OUR
COMPETITION — ANY AMATEUR MAY COMPETE.

£25 FIRST PRIZE AND A 21/-
WEEKLY PRIZE
AND SIX CERTIFICATES OF MERIT WEEKLY
For PHOTOGRAPHS of BABIES

Take him in his sun suit—take him when he baths.
Take him weeping, take him playing, take him
when he laughs.

RULES AND CONDITIONS:

The period of this competition is July 1st, 1937 to September 30th, 1937. Amateurs only are eligible. Write name and address, title of picture, and attach a Wallace Heaton Competition Coupon to the back of each entry. You can use any make of camera or materials and it is immaterial who develops, prints and enlarges your negatives. Entries may be any size, mounted or unmounted (not less than 8 x 6 unmounted is recommended). All entries to be judged by Wallace Heaton Ltd., whose decision shall be final.

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.)

Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made and no entries will be returned unless above is complied with.

Acceptance of these rules, etc., is a specific condition of entry.

ADDRESS YOUR ENTRIES TO "BABIES" COMPETITION.

WALLACE HEATON LTD.
127, NEW BOND STREET, LONDON, W.1

**WALLACE HEATON COMPETITION
COUPON** to be affixed to each entry.
Valid until Competition closes
on September 30th, 1937.

Enclosed is my entry for "....."
Competition. I agree to the rules and conditions.

CITY SALE

& EXCHANGE (1929) LTD.

We have the finest range of up-to-date apparatus in the country. Expert advice and demonstrations of any apparatus absolutely free, without obligation.

HERE'S WHY IT'S BEST TO COME TO US FOR YOUR APPARATUS:

● YOU GET UP TO 2 YEARS TO PAY ON A CONFIDENTIAL PLAN

Even the most expensive camera will only amount to a few pence a day on this easy plan. Anything £10 or over on 24 monthly payments, and anything over 50/- on 9 or 15 payments according to cash price. Every transaction is strictly confidential, and a square deal is guaranteed.

● YOU SAVE MORE MONEY ON YOUR USED CAMERA BY OUR EXCHANGES

In fact, it would be impossible to get such high allowances as ours wherever else you tried. Customers' letters quoting comparative allowances have proved this. Save money on your used apparatus by getting our exchange quotation now.

● AND YOU GET THE FINEST VALUE IN GUARANTEED USED BARGAINS

16/10 A MONTH for 24 months

With coupled range-finder, Compur Rapid shutter, speeded to 1/400th sec., Skopar f/3.5 lens.

Cash price £18 : 15 : 0

Why you'll certainly prefer the WESTMINSTER Out-of-Income Plan - - -

**The New
AGFA
'KARAT'**
12
pictures
24×36 mm.
(LEICA size)
for 1/5

Special f/6.3 anastigmat of very fine quality. Shutter gives speeds of 1/25th, 1/50th, 1/100th, B. and T., carefully designed for simplicity and maximum results. Automatic film wind renders double exposures impossible; easy loading with self-threading. Most efficient and accurate optical finder.

Write for Leaflet.

DOLLINA II

Chromium Finish.

36 pictures on standard ciné film, daylight loading, coupled range-finder, combined automatic film wind and exposure lock, Compur Rapid shutter to 1/500th.

TEMPle Bar 9773-4 (Private Branch Exchange)

The Westminster Extended Payment scheme differs considerably from others. It is a simpler, friendlier, speedier plan than most. The fact that when you deal with the Westminster it is with the WESTMINSTER only that you deal is a great safeguard—a safeguard that is confirmed by the valuable CUSTOMER PROTECTION that you get from the WESTMINSTER as a right. And there are special privileges in PART EXCHANGES—and other substantial advantages—in buying Out-of-Income from the WESTMINSTER.

EVER-INCREASING DEMAND for WESTEX MINIATURE

Lowest-priced high-precision miniature. With famous f/2.9 Radionar lens, focussing to 3 ft., Promitor II D.A. shutter, 1 to 1/175th sec., T. and B. Strong, beautifully made, easy and delightful to handle, optical direct-vision finder. Takes 16 3×4 cm. on normal V.P. £5: 12: 6
12 monthly payments of 9/11, 24 of 5/-.

NEW KINE-EXAKTA

Takes standard 24×36 mm. 36-exposure film. Shutter setting and film transport at one winding, speeds 1/1,000th to 12 secs. Easily interchangeable lens mount bayonet fitting. Built-in provision for dividing film, allowing separate development of any number of exposures.

With Zeiss Tessar £38: 10: 0
12 monthly payments of 67/5, 24 of 33/9

See what this
amazing Brilliant
Camera offers you!

12 pictures this size on
8-exposure film—and you
see them FULL SIZE as you
take them!

THE Voigtlander Brilliant is a camera you should know all about, as it offers features never before known in a camera of its price. First and foremost is its large-size view-finder, which shows you the picture crystal-clear and almost FULL SIZE while you take it. This ensures perfect composition in every photograph, and eliminates all danger of cutting off a portion of the subject. And then there's its amazing economy—you get 12 pictures $2\frac{1}{4}$ " square on standard 8-exposure $2\frac{1}{4} \times 3\frac{1}{2}$ " film. With a first-class Voigtlander anastigmat lens, speeded shutter and 3-point focussing it is really remarkable value. See it at your dealer's or write for the new Brilliant brochure which tells you all about it.

Voigtlander
BRILLIANT

With f/7.7 VOIGTAR 45/-
Anastigmat lens

Model illustrated has SKOPAR f/4.5 lens in Compur shutter and costs £5 15s. Other models at £3 15s. and £6 15s. For full details write to SCHERING LTD. (Voigtlander Dept. A), 185/192, High Holborn, London, W.C.1.

ILLUSTRATA AND BESSAPAN FILMS GIVE FINER RESULTS

No room for doubt!

You'll never have any doubts about your photographs being successful if you use the "AVO" Exposure Meter. It gives direct indication of correct exposure with unique clearness. Tells you at a glance the correct aperture and shutter speed to use for the light prevailing at the actual moment of taking the photograph. Simple, accurate, easy to read, it leaves no room for doubt about correct exposures.

A USER WRITES: "I have found the 'AVO' Exposure Meter to be the best investment I have made since buying my camera."

5 IMPORTANT POINTS:

- Method of indicating exposure is unique.
- Indicates exposures from 60 secs. to $1/2,000$ of a sec.
- Not affected by extraneous light.
- Size $2\frac{1}{2} \times 2\frac{1}{2} \times 1$ in.
- ✓ Held and operated in one hand.
- For Still or Ciné cameras.

63/- Morocco leather ever-ready case, 5/-

TO THE MAN WHO THINKS A GOOD MINIATURE CAMERA IS BEYOND HIS MEANS

Agfa Karat

WALLACE HEATON LTD.
 127, NEW BOND STREET
 LONDON, W.1
 EVERYTHING PHOTOGRAPHIC

GRAMS: ZODELLARIA WESDO LONDON.

PHONE: MAYFAIR 7511 (6 LINES).

Dear Mr. Amateur Photographer,

During the years that I have been marketing cameras, I have been continually amazed at the developments by the various makers in the miniature camera field. Such ingenuity has been displayed, that the miniature has, to all intents and purposes, definitely ousted the good, but necessarily more cumbersome, large apparatus. But this has not been achieved without new problems arising, and one of these problems has been the high price that the precision workmanship of the miniature necessitated.

The high prices charged for the real de luxe models left them outside the reach of many photographers.

This problem has now been solved by the new Agfa Karat in a manner that, used as I am to startling developments, really amazes me. How such a good camera, incorporating many of the features of cameras costing much more, can be produced at the modest figure of £5 5s. is genuinely remarkable.

It has a fine 1/6.3 lens, a shutter speeded up to 1/100th sec. and the usual T. and B., it has a cassette loading device that is the simplest possible. 10 secs. is the average loading time, and the cassettes are the 12-exposure type on 35-mm. film, so that you don't have to wait an unconscionable time to see your results. The lens panel snaps into position at the touch of a button. Blank or double exposures are impossible and the beautifully clear optical direct-vision view-finder is a delight to use.

The results I have seen are amazingly good. To those who have hesitated from miniature photography on account of initial expense, I would say don't hesitate any longer. For the small payment of 7/5 per month you can own this remarkable new miniature camera and I can promise you that our system of easy payments is strictly confidential.

Yours very truly,

Wallace Heaton

HAVE YOU HAD YOUR COPY OF THE WALLACE HEATON FREE HOLIDAY GUIDE?

A guide to better holiday photography. For instance, if you already own a camera our accessories list makes an excellent guide to more enjoyable and trouble-free photography. It contains such things as a new steel tape tripod, which takes up practically no room in the pocket and gives you the opportunity of making time exposures, which are not practicable in the hand. There are, of course, a large selection of other tripods. Then there's the Zodel lens hood which will enable you to face the sun and defy the snapshotter's rule of having the sun behind your back. Exposure meters are there galore, light filters to give you beautiful sky and cloud effects. In short, there is everything in our accessory list to make your photography more perfect and so to enhance the pleasure of your holiday. If you do not already own a camera, you will find the latest models illustrated and described in our Zodel Book, or if you want a ciné camera, there's a special list for them. In fact, we are the only firm who publish nine separate free books of guidance to everything still or ciné. Tell us what you are interested in, and enclose 2d. postage for the list or lists you need.

A special new list (not illustrated here) is our "39 Steps to Success," dealing with every service aid and facility to ensure better photographs.

SNAPS LIKE THIS MAKE MONEY FOR YOU!

This simple photo sold more than twenty times in less than two weeks. Why? Because it has "human appeal," which raised it above the ordinary mediocre prints of the average amateur.

6,000 British magazines, newspapers and advertisers buy literally hundreds of thousands of such photos every year. What a remunerative, open market for the ambitious free-lance who **KNOWS** what to take, and **HOW** and **WHERE** to sell! Editors are quite impersonal in their requirements. They will buy pictures at good prices from any **MAN** or **WOMAN** who can give them what they want.

WE CAN SHOW **YOU** WHAT IS WANTED . . . WE CAN ALSO PLACE AT YOUR DISPOSAL THE ADVANTAGES OF OUR ORGANISED MARKETING ADVICE AND SERVICE DEPARTMENT.

By the J.P.D. Personalised method we can develop in you that *sense of journalistic values* that is so essential if you wish to produce saleable pictures. Why continue to expend money and energy on results that give no lasting satisfaction, and certainly no financial return? Let us show you how to turn a hitherto expensive hobby into a source of added income and gratifying accomplishment.

No special camera, equipment or previous experience is required. Spare or full time, it matters not. You can work all the year round . . . the big demand for "human appeal" pictures is constant the year through. We also give authoritative guidance and collaboration in regard to photographic competitions . . . an additional source of camera revenue to the extent of many thousands of pounds annually.

The above photo was taken by a J.P.D. Member shortly after he became associated with us. **YOU, TOO**, can do the same. Are you interested . . . of course you are. Well, it places you under no obligation to send for this intensely interesting **FREE** book which discusses in detail the intriguing and profitable field of Journalistic Photography, and also gives full information as to scale of payment for photographs, etc. Send coupon **TO-DAY**.

Vol. LXXXIV. No. 2539.

IN American theatres and other places of entertainment, we hear, special performances are given at which "candid camera shooters" are invited to come and fire away. One such event is described in the *Chicago Tribune*. About sixty photographers are present, perched on all sorts of footholds, some of them kneeling, some on their backs, taking the chorus girls at every conceivable angle. Some of them even venture on the stage itself and do a quick get-away. The performance goes on apparently unheeding; some of the performers pretend to like it. But surely there is here, given more British decorum, an idea for our own theatre managers, and we have already written to several in London, at theatres where good photographic subjects are being presented. In most cases the idea has been turned down, in others it is "being considered." We still think, however, that it would be possible for one of the leading theatres to arrange a special photographic matinee to which all and sundry are admitted on exhibiting a camera. Let them move about at will, in stalls, dress circle, and gallery. It might be a good advertisement.

The Changing Scene.

That every scene changes its aspect many times between dawn and dusk we all know. The change is chiefly due to variations in the lighting. The exterior of Henry VII's Chapel at Westminster Abbey can be quite commonplace at one hour of the day and a thing of glory at another. It has remained for an American to say that it is not only the light which is responsible for the difference, it's your mood and emotion, my boy. In the morning do you not feel refreshed and eager,

TOPICS of the Week

Silver Birches on Wimbledon Common.
See article "Rus in Urbe" in this issue.

full of plans for the day, and does not it affect your look-out? By the afternoon have you not quietened down a little bit and become ready to call it a day? This same writer—who may, of course, for anything we know, be working in concert with the manufacturers of photographic material—urges American photographers just to photograph the same scene two or three times a day, and see how different it looks not only as the light affects it but as it is affected by your own emotion. Another way would be to point your camera at the same tree or campanile in different weathers, at different seasons, to get its spring, summer, autumn, winter look. Some very surprising and interesting sequences, he says, would be obtained. We believe him. When you have once photographed a particular object, however simple, you have only begun to get its picture. There are as many pictures of that object as there are varieties of lighting and atmosphere.

The Comic Turn.

There were all sorts of funny items on the programme of sports at the garden party attended by a royal duchess the other day, but the item that excited most laughter was the first event of all which was not on the programme. The moment they caught sight of the duchess with her decorous attendants walking across the lawn six Press photographers moved into action. They took the centre of the stage, they photographed her while they stood upright, while they bent at the waist, while they knelt on one knee, while they sprawled on the ground. The usual acrobatic performances were an anticlimax after that. When her royal highness disappeared to

inspect some Girl Guides the photographers all followed her; when she emerged again, there they were in front. To a royal personage the clump of Press photographers must be a perpetual eyesore. It is they who really dictate the pageants and the shows. They seem to have indulgence to invade every territory, to intervene in every programme. And all because they have behind them the great British public who will have their pictures next morning. But what wastage there must

be. How many releases of the shutter go to one reproduction in the Press? In the episode just described, on a modest estimate, sixty pictures must have been taken in ten minutes. A fairly exhaustive search of the daily Press revealed only one picture published.

Understandings.

A literary shop-window in Bloomsbury, almost opposite the British Museum, always engages us because the proprietor is constantly showing

examples of pictorial photography as it comes hot from the Continent. Many of these examples are freak photographs, but of a very ambitious kind, and we get into the habit, passing his door, of wondering what will startle us next. Apparently, the present fashion in Nazi Germany runs to the feet. We have views of a street pavement with a few pairs of feet. The picture may include the lower half of the leg, but no more. For pictures now it is necessary to grovel.

"The Amateur Photographer" EXPOSURE TABLE—July

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The subjects will be varied to suit the time of year. The following exposures will serve as a working guide for any fine day during the month, between the hours of 10 in the morning and 2 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 8 to 10 a.m. or from 2 to 4 p.m. double these exposures. From 6 to 8 a.m. or from 4 to 6 p.m., treble them.

N.B.—The times given above are by "sun time." The exposures, therefore, which are laid down as suitable for 2 to 4 p.m., for instance, will be those to be given between 3 and 5 p.m., by the clock, during "summer time."

SUBJECT.	Ultra-Rapid.	Extra-Rapid.	Rapid.	Medium.	Ordinary.	Slow and Process.
Open seascapes and cloud studies ..	1/1000sec.	1/700 sec.	1/400 sec.	1/200 sec.	1/100 sec.	1/50 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes ..	1/500 ..	1/300 ..	1/200 ..	1/100 ..	1/50 ..	1/25 ..
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes ..	1/300 ..	1/200 ..	1/100 ..	1/50 ..	1/25 ..	1/15 ..
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes	1/200 ..	1/100 ..	1/50 ..	1/25 ..	1/15 ..	1/8 ..
Buildings or trees occupying greater portion of picture ..	1/60 ..	1/30 ..	1/20 ..	1/10 ..	1/5 ..	1/3 ..
Portraits or groups taken out of doors, not too much shut in by buildings ..	1/25 ..	1/15 ..	1/8 ..	1/4 ..	1/2 ..	1 ..
Portraits in well-lighted room, light surroundings, big window, white reflector	1/10 ..	1/5 ..	1/3 ..	3/4 ..	1½ secs.	3 secs.

As a further guide we append a list of some of the best-known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above.

ROLL AND PACK FILMS.

Ultra-Rapid. AGFA I.S.S. and Isochrom roll and pack, Isopan I.S.S. (35-mm.). ENSIGN Ultrachrome. GEVAERT Superchrome Express and Panchromosa 28 roll and pack. KODAK S.S. 	Ordinary. BARNET Ordinary and Rapid Pan. Process plates. CRITERION E.R. and Ordinary. GEVAERT Ordinary. GRANVILLE Ordinary. ILFORD Rapid Process Pan., Ordinary, Chromatic, Infra-Red (with filter).
	Slow and Process. AGFA Direct Duplicate film. BARNET Process, Process Ortho., Fine-Grain Ordinary and Process Pan. GRANVILLE Process. ILFORD Process, Half-tone, and Fine Grain Ordinary.

If You Prefer PLATES

The advance in films has somewhat left plates in the background. At the same time there are advantages offered by plates, and this article deals with the subject from the point of view of the serious amateur.

IT is not so many years ago that plates were universally used by the serious amateur, the pressman and the professional photographer. But recent developments have influenced the situation. Cameras have been considerably altered in design, films have been brought to a high state of perfection, while apparatus for developing has made a corresponding advance.

This means that the advantages of plates are somewhat overlooked, in spite of the fact that one of the latest comers in the realm of miniature cameras is constructed for them.

While it is no longer possible to say that plates give "better" negatives than can be produced with roll films, it is true to say that for some subjects they are preferable, while they may be obtained in a variety not at present reached by the roll film. It is also true that many experienced workers still prefer plates.

Advantages.

Perhaps the chief advantage of plates is that they allow of one or two exposures being made and developed separately, without the necessity of wasting the remainder of a roll, or waiting until opportunities occur for making the remaining exposures. We constantly hear of photographers who are reluctant to wait until sixteen, eight or six exposures are made before developing. During a week-end, for example, one or two exposures may suffice, and here the user of plates scores a definite advantage.

There is also the fact to consider that the photographer is given the means of seeing the subject as it will appear, upon the focussing screen with which all plate cameras are fitted. Careful workers who have been accustomed to work in this way are reluctant to dispense with this method of composing their pictures. It also accounts for the large number of reflex cameras of the older type that are still used by photographers.

In the long run, it is possible that the plate user's bill for sensitive material comes to less than that of the photographer who uses roll films. It is admitted that the cost between that of plates and films is not very different, but the user of the former

probably makes fewer exposures. We know of photographers who claim that their work done upon comparatively large-size plates costs less than if roll films were used. This, however, is a matter for the individual.

Types of Plate.

The photographer who has a preference for plates will find no cause for complaint at the variety offered. This ranges from the slow or "process" plate, which is also to be obtained in orthochromatic and panchromatic form, to the fastest panchromatic. It may be said that there is a plate suited to every photographic requirement from the copying of black-and-white illustrations to the stage scene photographed from the dress circle, in which case the exposure has to be a fraction of a second. The photographer has between these two extremes a choice of material designed to give negatives of any type required from the contrast of the press subject to soft-gradation for portraiture.

Most of the makes of plates of various speeds that are now on the British market are included in the list given with "The A.P." Monthly Exposure Table (see the opposite page).

Choosing a Plate.

As with films, the plate photographer is inclined to choose the highest speed, paying great attention to what are unimportant differences in speed numbers. It has been repeatedly pointed out that these small differences have no practical importance, and a plate rated at 600 H. & D. by one maker may be no faster than one of 500 by another.

In addition, the photographer who wants quality in his negatives should choose the lower speeds. These offer ample rapidity for most subjects; they have a wider margin of exposure latitude. They are more free from tendency to fog; while they are of finer grain. Last year we advised a young photographer, who had been in the habit of using the fastest materials, to employ a slow orthochromatic plate for a special job. He was surprised not only with the ease with which good negatives were secured, but also at the big enlargements that could be made without the

least sign of grain. Few photographers using the very rapid materials upon subjects that do not require high speed, realise what they are doing. Not only are these more difficult to work, but the photographer also loses some quality.

The "Best" Plate.

The photographer of experience is often asked to give an opinion as to which is the "best" plate. The answer is that the best is the one that suits the particular work in hand, or if special qualities are not demanded, then the "best" is the one with which the photographer is most familiar.

While modern plates reach a high standard of quality, and there is little to choose between the productions of the best makers, there are some differences. For example, there are plates that produce a certain type of negative, such as "soft-gradation." Others differ in the speeds at which they develop; and there are some that are designed to produce negatives of the vigorous type for press work, and similar purposes. The photographer will be well advised to choose a plate which seems to meet his requirements with regard to speed and colour sensitiveness and to remain faithful to it until he is familiar with its working, and that there is need for a change.

For the very wide term "general work," probably the best type of plate is one of the soft-gradation panchromatic, or orthochromatic type having a speed rating of about 600 H. & D. This with suitable filters will cover a wide range of subjects.

Backed Plates.

The photographer will be well advised to use only "backed" plates. These are well worth the slight additional cost in the better negatives that they produce. Backing may not be necessary for any and every subject, but when the exceptional subject happens to be met with, presenting very strong lighting contrasts, the backed plate proves its value.

While dish development still finds favour with plate users, there are many excellent developing tanks available for plates. The worker who is familiar with the use of a roll-film tank will find no difficulty in dealing with one for plates.

RUS in

By
ARTHUR G. DEL

their environs and have never attempted serious photography on the local common may have an eye-opener in store if they take the advice of this article and give it a trial.

The quantity of interesting and often really pictorial subjects which can be selected from ordinary mundane scenes is quite amazing. All the photographs but one (which was taken in St. James's Park, in the heart of London) illustrating this article are a selection from the results of three visits paid to

THE LAKE, WIMBLEDON COMMON.
S.G. Pan., Alpha filter, 1/25th sec., f/5.6.

WITH subjects for the camera everywhere it is somewhat surprising that so many amateurs—many of them quite serious workers—only give pictorial photography a thought when the annual holiday comes round or when a visit to a renowned beauty-spot has been arranged.

Famous beauty-spots, very often, have a way of being a disappointment photographically. Conversely, many a fine landscape subject has been secured on a humble strip of common land.

Those who live in big towns and

SKYLINE. S.G. Pan., Beta filter, 1/75th sec., f/4.5.

Wimbledon Common during last summer. One visit was just an evening stroll.

London, of course, is noted for its fine open spaces, but many other large towns and cities have splendid parks and commons. Liverpool, Birmingham, Newcastle and Norwich, to mention some at random, are particularly favoured in this respect. Nearly every reader of "The A.P." living in a town will know of at least one such open space with trees within easy reach—a bus ride is generally enough.

If natural landscape is desired commons will usually be found better than parks, as the latter so frequently have railings, etc., which may mar many a pleasant vista from the photographic point of view. Commons, however, often present a stretch of land which, when photographed, is indistinguishable from a scene taken in truly rural surroundings, and free from undesirable elements.

Obviously the weather plays a big part in the results obtained, but any day of sunshine can be turned to good

IN ST. JAMES'S PARK. Verichrome, 1/25th sec., f/6.3.

URBE and a Camera

Hint for Summertime picture-making nearer home.

account if one is content to utilise the conditions prevailing and not to sigh for some other kind. For instance, if the sky is blue and cloudless abandon any idea of taking landscapes in which clouds are essential.

Instead of bemoaning the emptiness of the heavens on such a day go and search in the hollows and wooded parts and seek out subjects not requiring large expanses of sky. If there is

THE EDGE OF THE COMMON. S.G. Pan., Beta filter, 1/50th, f/5.6.

to the participants as to make them easy and unself-conscious subjects for the camera.

Exposures will vary considerably, as there are so many individual factors to be taken into consideration. However, the data given under the illustrations may be found useful in a general way, as the actinic value of daylight during the sunniest hours does not vary so greatly in the summer months, although due allowance must be made when working under trees, against the light or in the evening. An exposure meter is always a great help.

Fast panchromatic material and a light filter will generally be found to produce the best results, and a small, easily-handled camera will enable many shots to be obtained without attracting attention if figures are included.

For more open landscape subjects more time can be devoted to the selection of the best point of view, but it only needs a short excursion to the nearest common to convince the amateur that many fine pictures are awaiting him if he will take the trouble to look for them.

FEEDING THE SWANS. S.G. Pan., Alpha filter, 1/25th sec., f/5.6.

sunshine there is sure to be pleasing light and shade or unusual shadow pattern somewhere. Probably the much desired clouds will roll up later on, perhaps in the evening, when one may profitably return to the open heath and enjoy a spectacular sunset.

When human interest pictures are wanted there is little to choose between parks and commons. Both are pretty sure to be teeming with life in certain areas. Drinking-fountains are always likely spots, likewise the lakes and ponds with their never-failing attraction of boats, bird life and "tiddlers," all of which pastimes are generally so absorbing

Readers' Hints, Tips and Gadgets

A HOME-MADE GLAZING MACHINE.

GLAZING prints in a hurry is an exasperating business unless one is fortunate enough to possess a glazing machine. Machines, however, are both costly and cumbersome, but a satisfactory gadget which will meet the needs of most amateurs can be made for a few pence from a large tin canister and a length of flannel.

A round toffee tin about 10 in. high by 7 in. diameter will make a machine capable of glazing prints up to 10x8 in. The flannel should be about an inch narrower than the height of the canister and long enough to wrap round the latter about two and a half times. One turn of the flannel is permanently glued round the tin, the remainder being left loose to form an apron. Prints are squeegeed to a ferrotype or flexible chromium-plated sheet about the same width as the flannel and any length not exceeding the circumference of the canister. This is placed with the prints downwards on the apron and rolled with it round the canister. Two rubber bands secure it. All that is now necessary is to fill the canister with hot water, leave it for about fifteen minutes, and a perfectly glazed print will result.

If a number of prints are to be glazed, provision must be made for keeping the water hot and it is a simple matter to adapt the gadget to fit over a gas ring. First make sure that the lid is water-tight so that the canister may be turned on its side without emptying. A more satisfactory job is made if the lid is securely fastened and a small screw cap fitted. The top of a metal-polish tin soldered over a hole in the lid answers the purpose, or any tinsmith will fit a screw cap for a few pence. It is also advisable to fit a projecting collar round the bottom to prevent risk of the flannel catching fire. Here again the handyman can do this easily by using one of the shallow loose-bottomed tins sold for making cakes.

The water can be kept quite hot, but should not be allowed to boil. Either the lid of the canister should be loosened or the screw cap removed to allow the steam to escape.

H. BARLOW.

A SIMPLE SELF-ROCKING DEVICE.

WHEN developing (or fixing) plates and cut films, satisfactory results are best obtained if the liquid is kept on the move. This usually means a gentle rocking of the dish with the hand, a procedure that is apt to prove tedious, especially where complete development is likely to take several minutes.

So I put together the arrangement illustrated by the diagram, which shows the principle on which the rocker works. It consists principally of a large angle bracket screwed into the wall at a height of about 4 ft. from the floor and a hard-wood board which can be large or small according to the number of dishes you are likely to have upon it at one time.

Two round-headed screws are driven into the under-side of the board in such positions that when the board is placed on the bracket their heads rest in the fixing-holes by which the bracket is intended to be screwed into place. On these screw-heads the board will rock, being prevented from wandering out of place by the fact that the screw-heads rest in the holes in the bracket. To allow a reasonable angle of tilt, the screws should not be driven home in the wood.

To the edges of the board, and at equal distances from the bracket, two eye-hooks, or two more screws, are

inserted. To these hooks or screws two short lengths of stiff wire are now attached and their ends joined together to a third piece of wire measuring about 3 ft.

To this long wire a weight is fastened. An old flat-iron will serve admirably. Care must be taken to attach it so that it clears the floor easily.

If the board is heavy, or if the bracket projects right up to the front edge of the board, the fixing shown in the illustration will prove satisfactory, but if the bracket is short and the wood light the weight will tilt the board forward and pull it off the bracket. This can be prevented by attaching the two wires to the ends of the board instead of to its front edge, so that the weight hangs underneath the centre of the bracket. If thus set back nearer the wall, the weight must be pushed straight so that it does not, in swinging, bump against the wainscoting or the wallpaper.

When the pendulum is set gently in motion, the board will rock for several minutes without attention, leaving you free to attend to other jobs in the dark-room with the knowledge that your plates, cut films, etc., are being evenly and satisfactorily developed. Care should, of course, be taken to place the developing dish in the centre of the board so that the balance is preserved.

PHILIP ROSEN.

Finest Value in Coupled Range-

Finder Cameras

- For 8 or 16 pictures, on size 20 film.
- Coupled Range-finder.
- Optical view-finder built into range-finder unit with integral mask for small size.
- Conveniently placed release for simultaneous focussing and shutter release.
- Rising and Cross Front Movements.

ENSIGN AUTORANGE

ENSIGN Limited,
HIGH HOLBORN
LONDON, W.C.1

**IMPORTANT**

If you purchase a Zeiss Ikon Camera fitted with a Compur Shutter, or over £10 in value, ask your dealer for the Zeiss Ikon approved three years' guarantee.

Do you know what this is?

Our illustration shows the built-in shutter release on the camera body in the **New Zeiss Ikon Ikonta** for 12 pictures $2\frac{1}{4} \times 2\frac{1}{4}$ in. on the usual $3\frac{1}{4} \times 2\frac{1}{4}$ in. spool. The camera springs open ready for taking pictures at the touch of a button, and clearly illustrated in the picture is the optical direct-vision viewfinder which springs open simultaneously with the camera. The Ikonta $2\frac{1}{4} \times 2\frac{1}{4}$ in. provides the special 2-point setting of focus and stop, so that all pictures taken outdoors with a $1/25$ th second exposure will be sharp for distances over about 10 ft.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

FREE-LANCE WORK with a Miniature

Illustrated by A. M. CAMPBELL and J. G. McCAY.

The unconscious humour of the notice sold this three times.

IT is as well for the amateur to get it into his head right from the start that he cannot hope to compete with the professional Press photographer, at least as far as news is concerned. Carry your camera round in your hip pocket by all means, but don't wait for an accident to occur. Accidents are always news, but even if

you are first on the scene you may be sure the pressman will reach it too, and that his superior dark-room facilities will nullify any effort of yours to be first with photographs of the affair.

Of recent years the tendency of newspapers and magazines has been to "humanise" their photographs and so secure and hold the interest of the man in the street. Views from unusual angles, "candid" shots, street scenes, bizarre lighting effects—all exemplify this modern trend in Press illustration.

The miniature scores heavily in this game of gathering striking photographs. Its great depth of focus, its ability to make many exposures in rapid succession, and the small size and weight of the camera itself, all are points in its favour.

The Insignificance of Man. (This has sold once.)

Press standards are different from Salon requirements. Newspapers exist for the supply of information to their readers, and unless your photographs can be termed informative you are well advised not to send them. And make your enlargements rather contrasty, and on glossy paper.

Don't submit small prints; they will not give a fair idea of your picture's value. Send, whenever possible, whole plates. Study your markets and make a list of likely papers and magazines; very often you

A subject to be found in any town. But note that he is doing something. (Once reproduced.)

will find that a certain paper has a liking for some particular subject—perhaps babies, perhaps trees—and this you should note carefully.

Be very careful about your titles and captions. Give details, but avoid hackneyed wording like the plague! Remember that it is easy for an editor to cut your caption down to suit his requirements, but next to impossible to amplify it, because he has no information beyond what you send him.

There seems to be an impression amongst amateurs that they lose copyright in their pictures when they are reproduced. That is not so; you relinquish your copyright only when you sign an agreement to that effect. The half-guinea or so that you receive is payment for reproducing your picture once, and only once. A. M. C.

This rather "newsy" type of street scene sells well to local papers.

A striking view, enhanced and scaled by the figure of the climber (Sold three times.)

July 7th, 1937

ANGLING *with a Miniature* By "SPYEYE."

WHEN the angler considers the possibility of a day in the country, his thoughts turn towards trout, mayflies, olive duns, march browns and the lovely little stream that tumbles and glides between willows graceful and shimmering in their recently

Your rod is all set up, your net over your shoulder, and if you are wise, you will put your miniature camera over the other shoulder. If you haven't a range-finder model, set your focussing to 50 feet and the shutter to 1/40th or 1/50th of a second and the diaphragm to f/4.5. Do not forget your 2x filter and an efficient lens hood. A medium speed panchromatic film will give you softly-graded colour-correct negatives. This is important, as the greens are very varied, and these and any flowers which enhance the foreground value must be rendered in their true tones. There is nothing hard in the landscape, and the fairly large aperture suggested will keep the roundness and feeling of atmosphere which smaller stops only destroy. The miniature user should remember that with the lenses normally fitted to these cameras it is not necessary to stop down excessively unless extreme depth of focus is

"Casting over the Rise." 1/40th sec., f/4.5, Panatomic film, Leitz O filter.

spread foliage. Memories of last year's tussle with a game one-pounder in the lovely little pool with the big sunken root in it; how your heart beat as he tore at top speed straight under it, and how, by sheer luck—you think it skill—you got him out. Will there be another big fellow there this year? Will that old dog otter still take his toll of some of the best fish? Hope they've shot him! I doubt it, though; you'd never see him if you had a gun, but if you hadn't he would run along the bank and his little beady eyes would twinkle and say, "You think you can fish? Well, I could give you a few tips."

"On the Alert." 1/40th sec., f/4.5, Panatomic film, Leitz O filter.

"Landed at Last." 1/30th sec., f/4.5, Panatomic film, Leitz O filter.

needed. In fishing subjects this is not likely, and anything smaller than f/6.3 is seldom called for. At fifty feet you will get the rod well in the picture, as well as enough of the landscape. In close-up shots such as "Landed at Last," set your focussing to about 10 feet and your shutter to 1/25th or 1/30th.

Now you can show the doubting Thomases that you really did catch those trout. Haven't they mercifully "pulled your leg" sometimes? It's your turn to laugh as you produce a 12x10 of your best fish and prove that you are not so closely related to Ananias as they seem to suspect.

Try combining your fishing with photography, and you will enjoy greater fun in both.

Removing Black Spots from Enlargements By CLARENCE PONTING.

DUST on the film at the time of exposure leaves tiny clear spots or "pinholes" on the developed negative. What is the miniature worker to do with the resulting large black spots on the enlargement?

In order to remove them they must be made white by some means, and as this is almost impossible by working on the negative it is from the print that they must be removed. The black spots are, of course, only emulsion deep, and in expert hands can be easily scratched out with a lancet trimmer mounted in a penholder. An expert can even erase them to exactly the same shade as their surroundings, which, of course, needs no afterwork with a brush and pigment. The only objection to the use of the lancet blade is that the scratched spot can be seen as an abrasion if the print is held against the light.

My method of removing these spots, or rather to render them white without abrading the surface of the emulsion, is to reduce them entirely by means of a brush charged with a concentrated solution of Farmer's reducer. In this way spots can be removed with certainty by the merest beginner. I use a No. 6 sable water-colour paint-brush, which can be drawn to a point as fine as a pin when moistened with the solution. A plain solution of hypo and water, strength 4 oz. of hypo to

20 oz. of water, is kept specially for the purpose, as the acid hypo used for fixing prints and negatives will not serve.

When it is desired to remove spots from an enlargement, about a teaspoonful of this solution is poured into an egg-cup, and close by is placed a large crystal of ferricyanide of potassium. The brush is then dipped in the hypo solution, touched on the ferricyanide crystal for about two seconds, then drawn to a fine point. Working on the dry enlargement, the point is then applied to the black spot, which immediately disappears, leaving behind one of pure white, for the silver image of the spot has been dissolved away. The print is then washed, and, when dry, the white spots are matched by filling in with water-colour paint applied with the same brush that was employed to reduce the black spots.

There is no danger of these spots becoming yellow, as sometimes happens when local reduction is done with this reducer. When the reducer acts rapidly no stain occurs. Even if this was the case, the area is so small that the yellowing would be obliterated and covered by the pigment. This method of removing black spots will prove a godsend to the miniature camera user.

One word of warning: Don't suck the brush. Ferricyanide is not venomously poisonous, but it is also not good to eat.

Modern Miniature Cameras

THE DOLLINA MODEL III.

THE Dollina Model III is a de luxe miniature camera taking 35-mm. ciné film in the usual daylight loading cassettes, and making on each strip 36 exposures each 24×36 mm. When closed, the lens is completely protected by a baseboard. On pressing a catch at the top of the camera, this springs open and the lens front flies forward on lazy-tongs.

Focussing is controlled by a knob on the top of the camera, and operates by extending the lazy-tongs which carry the front. The range-finder, of split field type, is coupled to the focussing movement and is built into the body of the camera. The camera can be focussed equally well closed or open, using either the range-finder or the scale on the focussing knob. The nearest point that can be focussed upon is a little under 3 ft., but a supplementary lens is available for focussing to about 15 inches when desired.

Shutter Release on Body.

In the Model III the release for the Compur shutter takes the form of a plunger on the top of the camera body, which makes for very much steadier holding of the camera than a release on the shutter itself. Once depressed, the release is locked until the film is wound on, thus making inadvertent double exposures impossible. In order to allow for using the "Time" movement of the shutter, for which the release has to be depressed twice, a release-button is fitted. This is also useful if for any reason a double exposure is required, or if the shutter release has been depressed without first setting the shutter.

After each exposure, the film-winder has to be released; this done, the film is wound on until the mechanism automatically locks after the passage of the correct number of perforations across the sprockets inside the camera.

For loading, the back of the camera hinges open, and the cassette is dropped into the spool-chamber and the rewinding knob is engaged with it. The take-up spool has a slit into which the tapered end of the film is pushed; on turning the spool a little, holding meanwhile a knurled rim at one end of it, the film is firmly clamped in position. For rewinding, the knob on the take-up spool is withdrawn, thus allowing the spool to turn backwards as the film is drawn back into the cassette. A counter at the top of the camera records the exposures made; by turning a knob it is set to zero, when a new film is inserted.

The camera is well finished in black leather and chromium plate, and has a very smart and up-to-date appearance.

A short length of film exposed in the camera provided us with a set of negatives that could be enlarged to almost any degree, and there can be no doubt that the Dollina III is capable of work of the highest grade.

The camera is available with an $f/2.8$ Xenar, an $f/2.8$ Tessar, or an $f/2$ Xenon, all of 5-cm. focal length. With Compur Rapid shutter to $1/5000$ sec. the prices are £18 15s., £21 17s. 6d., and £22 17s. 6d. respectively, or £17 10s. if fitted with the Xenar lens in Compur Normal shutter of highest speed $1/3000$ sec. Filters and a lens-hood to fit the various lenses can be had at reasonable prices.

The Dollina III, the dimensions of which are $5 \times 3 \frac{1}{2} \times 1 \frac{1}{2}$ in. over all projections, and which weighs 19½ oz., is obtainable from all dealers. The sole importers are Messrs. Actina Ltd., 29, Red Lion Square, W.C.1.

Miniature Camera Gossip

By LANCELOT VINING.

MY luck seems, in some respects, to be decidedly out. I recently tried one of the new Agfa colour films, and for this persuaded my friends and relations to dress up in bright colours for me, visited gardens, and arranged still-life subjects. Now I hear that by some mischance the film is lost.

So, apparently, is my speed-gun. I heard from the makers in America that they would be pleased to add to it the latest improvements, but that so far it had not reached them. I still have hopes of it, but I am beginning uneasily to wonder what the next catastrophe will be.

Champlin No. 15.

Last week-end I set about testing this much-discussed developer. I have been assured that although it contains paraphenylene-diamine, it does not require any extra exposure, and that the results are grainless, even with the

the result of this I think I shall find on further testing that the Agfa F with D76 will just about equal I.S.S. with No. 15 for speed, and will beat it on the grain question.

New Leica Lens.

I hope shortly to be able to tell you something about the new $f/1.5$ lens for the Leica, as Messrs. Leitz have promised me one to test. I intend to give it a pretty comprehensive trial, and hope to publish some of the results.

An Old Friend.

I looked in on Maurice Chevalier at the Casino de Paris recently, and found that if he has lost some of his hair, he has not lost his smile. He knew I wanted a photograph, and reminded me of the last time I photographed him, which was at the Dominion Theatre in London.

I did not tell him that on that occasion I had badly under-exposed, so that the result, all face and shirt-front, was so bad that it was never even printed. However, I had at least this much excuse, that it was one of my first theatre pictures with a miniature.

Paris Exhibition.

The huge figures on top of the Russian Pavilion at the Paris Exhibition make a good subject for the long-focus lens, especially if you can get the right clouds. As the illustration shows, a red filter helps.

Maurice Chevalier at the Casino de Paris.

fastest film. This sounds ideal for fast theatre work.

As this developer has eleven ingredients I decided to have a trial Winchester made up by Griffin and Tatlock, as I was most anxious that fresh chemicals should be used.

I made my usual test, the subject being lit by electric light. I used the new series I.S.S. and my meter reading was $1/100$ th at $f/2$. I gave exposures of $1/25$ th, $1/10$ th, $1/5$ th and $\frac{1}{2}$ second, then left three blanks and repeated these exposures. Cutting the film in half, I developed one half in D76 and the other in Champlin No. 15.

I found that the No. 15 does definitely slow the film, and comparing the two results, I find the D76 $1/100$ th is about equal to the No. 15 $1/5$ th, but the improvement in grain with the No. 15 developer is very marked. From

85-ft. figures on Russian Pavilion 120 ft. high. $5\frac{1}{8}$ -in. Sonnar at $f/5.6$, red filter.

TEN GUINEAS AND UNDER

A Section for the User of the Inexpensive Miniature.

Photographing Ships at Sea

A CAMERA which can be carried in the vest pocket, such as the Ensign "Midget" which I use, enables those who "proceed on the sea on their lawful occasions" to take

How steam vessels pass, overtake, and cross at sea. In the case of vessels crossing, it will be seen that A gives way to B, and then B has to give way to C.

advantage of any opportunities which arise on voyage for marine photography.

Photography at sea may be divided into two classes—the first of subjects taken within a ship, and the second of subjects, such as another vessel, taken from a ship.

The first does not call for any changes from shore practice, but the second brings a number of problems new to one who has exercised his hobby ashore. To those on the sea, whether by profession or during the course of a holiday, there is much interest to be found in making "record" photographs of ships that pass, at the same time trying to make these records real pictures when the circumstances are favourable.

The first difficulty is likely to be that of viewpoint. The landsman can pick his with due regard to the subject and the lighting, but those at sea are dependent upon the respective courses of the vessels concerned. It is, therefore, an advantage to have a rudimentary knowledge of the "rule of the road" governing the movements of vessels which are close to one another. So far as the photographer is concerned the procedure can be summarised as follows: (1) A steam vessel overtaking another has to keep clear, but it may pass the overtaken vessel on either side. (2) Steam vessels on opposite courses, meeting each other end on, each alter course to starboard and so each passes the other on her own port (i.e., left) side. (3) When two steam vessels are on crossing courses, so as to involve risk

of collision, the vessel which has the other on her own starboard side shall keep out of the way of the other—which she does by going to starboard (i.e., right) and so passing astern of the other vessel. (4) Steam vessels have to keep out of the way of vessels in sail. The procedure may sound complicated, but is really simple, and the small sketch shows how it works and where the best chances for the photographer arise, bearing in mind that ships look most graceful when taken from towards bow or stern, thus securing a three-quarter view, and that with a short-focus lens it is essential to secure the picture when the vessels are close together, as otherwise the image will be too small even with a high degree of enlargement. "Outward Bound" was taken from a vessel which had had to alter course to pass astern of that photographed.

A further point to be considered is of the place on board from which to make the exposure. Viewing a fishing-boat from the upper decks of the *Queen*

Mary gives about the same perspective as that of a motor bus from the top of the Nelson column—so look out for the lowest deck from which a good view can be obtained.

"Entering Dock," taken for record purposes, was secured from a point about ten feet above water-level, while the other

was made from a deck thirty-five feet above the sea and illustrates the difference in perspective.

OUTWARD BOUND. Taken from a deck 35 ft. above water-level.

ENTERING DOCK. Taken from about 10 ft. above water-level.

Owing to the light at sea exposures can be shorter than is usual on land, and a meter should be used. General reflection from the sea renders it imperative to shield the lens.

F. W.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

AN OLD MINIATURE.

I have a 4.5 x 6 cm. plate camera with fixed-focus lens. This is marked "Ihagee Anastigmat Trioplan 1:6.3 F=6.5 cm." At what distance would infinity be to give sharp enlargements up to (a) quarter-plate and (b) whole-plate? Do you know the make and original price of this camera?

C. H. B. (Bournemouth.)

From your description your camera would appear to be of Ihagee make. The agents for this make of camera in this country are Messrs. Garner & Jones, Ltd., Polebrook House, Golden Square, London, W.1, who will be able to give you more information about it than we can.

If the lens is actually set to true infinity, objects could be as close as 16 or 32 ft. before showing unsharpness when the negative is enlarged to quarter-plate or whole-plate respectively. If, however, the lens is set on the hyperfocal distance for whole-plate enlargements (that is to say, if it is focussed on 32 ft.), objects from 16 ft. to infinity will be sharp when the negative is enlarged to this size.

SIX-EXPOSURE V.P. FILMS.

Can you please tell me the name of a firm who make V.P. size films in six-exposure spools?

G. W. D. S. (Sheringham.)

Six-exposure V.P. films are made in the standard grade of orthochromatic film by several makers, and the code number for the size is 21. One firm at least offers also a "chrome" film at 1s., and either of two types of panchromatic film at 1s. 3d. This size of spool is no longer commonly used, but even if your local dealer does not stock it he can obtain it to order.

GRAPHITE ON LENS.

I recently had the shutter of my Baby Ikonta repaired, and it was apparently lubricated with graphite. After each exposure some of this works down and adheres to the inside face of the lens components. Will this affect exposure or definition in any way?

J. I. S. (Southampton.)

Such small particles of graphite as you are likely to get will not affect the working of the lens in any way; their sole effect will be to obscure and scatter a very trifling proportion of the light. Until the excess of graphite has worked out you should unscrew the components now and then and very gently dust the glass with a soft camel-hair brush.

D76.

Will you please give me the formula for this developer and the times for development? Also, should I wish to stock this developer in packets, what is the best way to go about it? C. H. (Newcastle.)

The formula for Kodak D76 developer was given in our issue for June 16th under the heading of "Facts and Formulae." The time of development depends on the temperature, on the film used, on the subject photographed, and on the degree of contrast required in the negative, but as a starting point, we would suggest that you try ten minutes' development at 65°, using an ultra-fast film, or about 6 minutes for a film of medium speed. These times will give soft negatives suitable for enlarging on a fairly contrasty paper, such as the miniature worker generally prefers.

If you wish to stock this developer in packets you can obtain them ready packed from Messrs. Kodak Ltd.

STAINED BY METAL CLIP.

The stains on the enclosed negative were caused by the action of a metal paper-clip used to hold it during development in a paraphenylene diamine developer. Can you suggest any means by which these stains can be removed? A. W. B. (Middlesex.)

The stain appears to be on the surface of the negative, and we think that you will be able to remove a good deal of it by soaking the film in water and then rubbing the surface briskly with a wad of cotton-wool. Any stain that remains after this treatment can probably be removed by treating the negative when it is dry again with Baskett's reducer. As your experience has doubtless taught you, photographic chemicals should never be brought into contact with metallic objects other than those intended to resist their action.

WHY LEICA?

THIS is the 12th year of Leica photography. From a series of a few dozen, the manufacture has grown to several thousand and the number of satisfied Leica users has reached a quarter of a million. The reasons for the sweeping and lasting success of the Leica camera are its outstanding advantages and novel features designed for practical use and not by way of a stunt ; the precision with which our firm, as the world's largest microscope manufacturers, is qualified to make the apparatus ; our principle not to supersede models frequently, and lastly our policy of designing, wherever possible, new models so that old cameras can readily be converted to the latest.

THE PIONEER AND LEADER

The Leica camera is the smallest and lightest universal camera. Its built-in range-finder has not added to its over-all dimensions, its form is still of the same dignified beauty and the most convenient for handling and carrying. The stability of design, which has not undergone any radical changes since its creation 12 years ago, is a wonderful proof of its perfection and one of the reasons for the continued success of the Leica camera. Here, as in all walks of life, it is stability which scores in the long run.

In the Leica the mechanism is accommodated in the minutest compass which will allow of reliability and such accuracy as is necessary for a universal camera with interchangeable lenses, and its dimensions are the smallest which will permit of conveniently handling the apparatus in practical photography.

The specific advantages of the Leica are set out in our profusely illustrated booklet, "Leica, the Camera of Modern Times."

"Leica News and Technique," a bi-monthly journal devoted solely to Leica photography, is available to Leica users in Great Britain who register their camera number with us.

All Leica catalogues as also a sample copy of "Leica News and Technique" are sent free on request. Ask your nearest dealer for a demonstration.

E. Leitz (London), 20, Mortimer Street, London, W.1

THE LEICA STOOD THE TEST OF TIME

HIS MAJESTY THE BABY!

Oh, kings may come, and kings may go, but babies reign for ever! We know that some of the hardened celibates we number among our friends will grin sardonically when they read this, but "Let them grin!" say we. Child photography, whether sentiment enters into it or not, is a fascinating art, and whatever camera you use, child studies will captivate your imagination. If the babe be your own, then your pleasures will be manifold, for in the first place you will have the usual enjoyment that one obtains from the very practice of photography, and, in addition, you will have the present pleasure of seeing your offspring as he is, the prospective pleasure of portraying him as he grows, and the retrospective pleasure of seeing him as he was when he was "so high."

If you do go in for child portraiture, however, you'll need a good fast lens, and an easily handled, rapid in action miniature. If your present camera does not fulfil these essential requirements, then obviously the best thing to do is to get in touch with "202," and we shall be delighted to quote you a part exchange allowance on your present miniature against a camera that will definitely bring home the bacon (or, in this case, the baby!). If necessary, the allowance on your present model can represent the initial deposit in a hire purchase transaction, and we can assure you that you will be more than pleased both with the generosity of our allowances and the excellence of our service.

The following used miniatures may be purchased from us with that same feeling of safety that you would experience when buying a new camera. In fact, you may have more confidence in these cameras since, in addition to being covered by our guarantee of optical and mechanical perfection, they have already grown up in active use.

LEICAS:

Model IIIa Leica, f/2 Summar lens, E.R. case. Excellent condition	£35 10 0
Model IIIa Black Leica, f/2 Summar, E.R. case. As new	£34 10 0
Model IIIa Leica, f/2 Summar, fitted quick-wind attachment. Condition as new	£37 10 0
Leica III, black, f/2 Summar. As new	£31 10 0
Leica III, black, f/3.5 Elmar. As new	£24 17 6
Leica II, black, f/3.5 Elmar. As new	£19 10 0
Leica Model 250, f/2 Summar, ever-ready case. Excellent condition	£39 10 0
Leitz 7.3-cm. f/1.9 Hektor, coupled. Good condition	£19 10 0
F/1.5 Plasmal Lens for Leica. As new	£17 6

Contax I, latest wedge-type range-finder, f/2 Sonnar. As new	£32 17 6
Contax I, latest wedge-type range-finder, f/2.8 Tessar. As new	£25 17 6
Contax I, latest wedge-type range-finder, f/3.5 Tessar. As new	£23 17 6
Contax I, earlier pattern range-finder, f/2.8 Tessar. Good condition	£19 10 0
Contax I, earlier pattern range-finder, f/3.5 Tessar. Excellent condition	£18 5 0
Zeiss 8.5-cm. f/2 Sonnar Lens. Excellent condition	£25 10 0
Plate Back for Contax Model I, complete with slide. As new	£2 17 6

Miniature Cameras fitted with coupled Range-finders:

Nettax, f/2.8 Tessar. In excellent condition	£26 10 0
530/2 Super Ikonta, f/4.5 Triotar, Klio shutter. Condition as new	£10 5 0
Super Ikonta 530/15, f/4.5 Tessar, Compur, ever-ready case. As new	£14 15 0
Super Ikonta 530/2, f/4.5 Tessar, normal Compur. As new	£13 0 0
Super Ikonta 530/16, f/3.5 Tessar, Compur. As new	£19 10 0
530 Super Ikonta, f/3.5 Tessar, normal Compur. As new	£13 10 0
530 Super Ikonta, f/3.5 Tessar, Rapid Compur, E.R. case. As new	£14 17 6
Super Ikonta 530/16, f/2.8 Tessar, E.R. case. As new	£23 17 6
531/2 Super Ikonta, f/3.8 Tessar, Rapid Compur, as new, and complete with 2 filters, lens hood and case	£23 17 6
Baldaxette I (16 on 3½ × 2½), f/2.8 Tessar, Compur, parallax compensated view-finder. As new	£13 18 6
Baldaxette II, f/2.8 Xenar, normal Compur. As new	£13 18 6
Compass, f/3.5 lens, tripod and combination case. As new	£24 10 0
Roland, f/2.7 Plasmal, Rapid Compur. As new	£21 10 0
Peggy Model II, coupled range-finder, film-cutting device, 4 cassettes, filter, ever-ready case. Cost approximately £36. As new	£22 10 0
Contameter for Super Nettel. As new	£7 15 0

MINIATURE REFLEXES:

Multispeed Lever-wind Exakta, f/1.9 83-mm. Super-Six lens. As new	£27 10 0
Exakta Model A, f/3.5 Exaktar. As new	£11 17 6
Exakta Model A, f/3.5 Tessar. As new	£13 17 6
Rolleicord I, f/3.8 Triotar, case. As new	£10 17 6
Rolleicord II, f/3.5 Triotar, E.R. case. As new	£14 10 0
Rolleicord II, f/4.5 Triotar, normal Compur, E.R. case. As new	£11 17 6
Rolleiflex 6×6, with f/3.5 Tessar, Rapid Compur ever-ready case. As new	£19 10 0
6×6 Automatic Rolleiflex, f/3.8 Tessar, case. Excellent condition	£16 15 0

MINIATURE REFLEXES—contd.:

4×4 Rolleiflex, f/2.8 Tessar, case. As new	£17 15 0
4×4 Rolleiflex, f/2.8 Tessar, Rapid Compur, E.R. case. As new	£20 10 0
Non-auto. Rolleiflex, f/3.8 Tessar, case. Good condition	£8 5 0
Contaflex, f/2 Sonnar, ever-ready case. As new	£55 0 0
Plate Back for Contaflex and 1 Slide	£3 7 6
Extra Slides, each	5s. 6d.
Foth-Flex, f/3.5, without slow speeds	£6 10 0
Pilot Reflex, f/3.5 Tessar, normal Compur, case. As new	£12 0 0
Pilot Reflex, f/2.8 Tessar, normal Compur, case. As new	£14 10 0
Noviflex, f/3.5 Victor. Condition as new	£7 10 0

MISCELLANEOUS CAMERAS:

Nagel Vollenda, f/4.5 Radionar, 3 speeds. As new	£3 3 0
Kodak Six-20 Duo, f/4.5 lens, Compur shutter. As new	£6 15 0
Baldina, f/3.5 Trioplan, normal Compur, parallax compensated finder. As new	£6 19 6
Perkeo, f/3.5 Skopar, Compur. As new	£5 15 0
Miniflex, fitted f/3.5 Astro Astan, Compur shutter. As new	£6 18 6
Miniflex, fitted f/3.5 Victor, Vario shutter. As new	£2 15 0
Kodak Six-20 Duo, f/4.5 lens, 3-speed shutter	£4 7 6
Agfa Speedex, f/3.9 Solinar lens, portrait attachment. As new	£3 19 6
Plaubel Makinette, fitted f/2.8 Anticomar, Compur shutter, yellow filter, and case. Perfect condition	£10 17 6

WE WANT THE BEST CAMERAS—
and you probably have one of them. If you are for any reason at all unable to use your present miniature, why not turn it into ready money until you are able to go in for the photographic game again? You may depend upon it that you will obtain the best price for your apparatus from us, and you will find the whole transaction a pleasure from beginning to end.

HERE IT IS!

The Model 520/16 is now available, and we illustrate here the model fitted with f/3.5 Tessar and Compur

Rapid shutter, the very reasonable price of which is £13 only. This camera takes 12 pictures 2½ in. square on the standard 120 film, has the new body release, and is in every respect a superb piece of workmanship. If the 530/16 with the coupled range-finder is more than you wished to pay, then the 520/16 is undoubtedly the next best thing.

CHAMPLIN 15

This developer makes your film twice as fast! Funny, but it's true! After all, when using it you need give only one-half the normal exposure to obtain perfect negatives—negatives, that is to say, showing perfect gradation and in which grain is conspicuous by its absence! This developer is a somewhat difficult one to make up oneself, as it contains eleven separate ingredients, many of which are rather difficult to obtain. Realising this, we have produced a concentrated developer, suitable for making 500 c.c.s of solution, and this costs 4s. 9d. per bottle, with 6d. for postage. If you are an enthusiast, you should get your own opinion of this much-discussed formula!

WHAT AN ENLARGER!

We can supply the Focomat II from stock; it is such a marvellous piece of apparatus, and embraces so much that we cannot tell you about it in the short space available here. Write to us for the R. G. Lewis booklet on enlargers; this gives full details, and at the same time ask for the allowance quotation on your present model against this paragon of all enlarging virtues.

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780)
(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXCIII.

Mr. EDWARD
ALENIUS.

From information communicated to our Special Representative.

"PICTORIAL photography, my favourite hobby, has been occupying my interest for the past nine years, having afforded me a delightful pastime, and a wealth of pleasure. Before 1928, I had been, for a good number of years, a casual snapshooter with but a simple Kodak camera, and had collected a great many negatives. When my interest in the art began to increase several of these were found to have pictorial possibilities, some of them even fifteen years old. These were the beginning of my desire to learn more about this fascinating art, and I gained a great deal by reading back numbers of photographic magazines and books.

"Ribbons and certificates soon became a feature, and in 1932 I crashed the salons, with two bromoils accepted in the Chicago International. Since then I

have been an enthusiastic exhibitor, having missed but few open exhibitions.

"There seems to be much unfavourable criticism of quantity print acceptances, and a great many old-timers are prejudiced, as they may not realise that for successful quantity acceptance of prints there must be quality. The fact is also often overlooked that the man with a hundred prints accepted has ten times greater satisfaction than the man with only ten accepted. He has also ten times more pleasure—and ten times harder work. My suggestion is to give him credit for a hundred prints. Undoubtedly, they are not inferior to the ten-man's prints; quite the contrary, perhaps.

"In the early days of my photographic endeavours, I used various processes to obtain better prints from

poor negatives; in fact I have tried most of the processes. The aim for perfect negatives lessens the necessity of processing, and increases time for leisure.

"There is no type of photograph that I favour. Therefore, among my exhibition prints will be found landscapes, snowscapes, marines, still-life, portraits, nudes, character studies, colour-prints and infra-red photographs. Prints from paper negatives appeal to me as much as do those from f/64 negatives. I am not opposed to miniature photography. Composition of the picture is the only fact about which I am particular.

"My favourite cameras are a 9 x 12 cm. Duplex with several lenses of 3 in. to 8½ in. focal length, a Roland miniature, and a 6½ x 8½ in. view camera. Yellow, green and tricolor filters are in my kit, also a Pola screen. I use Eastman and Agfa Orthochromatic and Panchromatic films; Panatomic for the miniature camera; with full exposures and slight under-development. My favourite developer for films and prints was amidol before I contracted amidol poisoning; now I use M.Q. and amidol, and for miniature negatives, D76.

"My prints are made on bromide, chloro-bromide, chloride and Fresson paper. The picture entitled 'Winter Night,' at Central Park, was made on chloride paper, from a practically unretouched negative. Incidentally, it was taken on a cold February night with the temperature below zero. The exposure was three minutes with f/4.5. On account of the darkness the ducks on the pond were not visible.

"I do all the photographic work myself, and this includes retouching, mounting, wrapping and shipping, also standing in line for foreign money orders. My method of wrapping the prints for mailing and shipping is foolproof, and very seldom are they corner-bent, or damaged.

"Lecturing and teaching photography have limited my time for the making of more pictures, but I hope to be able to do photography to my heart's content some day, and to my own and others' satisfaction."

(A further example of Mr. Alenius's work is reproduced on one of the centre Art pages.)

A CELLAR CORNER.

Edward Alenius.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THE TWO OF US," by Geo. C. Backhouse.

UNDOUBTEDLY the combination of figure and shadow here is a thing that offers considerable opportunity for pictorial treatment. The sunlit figure of the child on the right forms the main theme, her shadow makes a secondary point of attraction, there is an excellent connection established between the two, and the sunshine itself lends a brightness and glow that admirably enhances the appeal.

The contrast between substance and shadow is well brought forward, and at first glance the interpretation seems very creditably managed. It is true that a question seems to arise in connection with the relative placing of the two elements, the shadow being more "in" the picture than the figure and therefore seeming to be more strongly placed; but there may be a measure of justification in the fact that both are facing the left and more space on that side is desirable. On this particular point, however, there may be a divergence of opinion, and if it should be felt that the positions need correction, a trim of somewhere about one inch from the left removes any possible cause for objection, although, if it be feasible to make a slight addition on the right, half an inch would be found beneficial.

But, on looking further into the picture, I find myself wondering whether it is altogether in accord with an entirely natural rendering or if there is not something of a conflict with realism. The impression I gather is that the shadow tone in the upper portion of the left-hand side is too nebulous and unformed to be real, and I feel that it has been introduced by handwork or some method of after-treatment.

If you look at the perfectly genuine shadow of the gatepost on the extreme

right, you will see that its edge is comparatively sharply defined, and that although there is a slight difference between it and the edge of the shadow of the child, the somewhat increased diffusion of outline does not amount to much, despite the difference in distance between the objects and their respective shadows. Judging from the lack of formation of the darker tones above, the object throw-

the diffusion of the edges had been passed, and as far as distinctions of texture were concerned, they would be more sharply defined and readily discernible for what they were, in just the same way that they are shown in the shadow of the gatepost on the right.

Moreover, it is scarcely conceivable that such shadows would so dispose themselves as not to encroach upon or join up with the shadows of the child and wall below, and they certainly could not cast a shadow over an existing shadow as they appear to do on the extreme left where a bit of the lower shadow tone projects itself upwards along the edge.

This latter feature seems to me proof that control has been exercised, and taken in conjunction with the other discrepancies I have mentioned, and certain other indications—in the neighbourhood of the child's head where the demarcation between light and darker tone seems indecisive, and the absence of any extension of the sunlit area on the wall behind the figure to its front—it makes that

control too much in evidence to be acceptable.

No reasonable person, I think, would object to control, even to such an extent as this, provided it defies detection and does not invite the suspicion that the result arises from two different media. If the photographic character of the image remain unimpaired, as it must if the after-treatment is properly executed, I would maintain that the end justifies the means, but it would be wise not to embark upon handwork unless the knowledge of what the photographic rendering ought to be is at the command of the operator.

And knowledge of this kind only comes with experience and from a considerable amount of observation.

"MENTOR."

ing the shadow must be at quite a considerable distance away, and presumably could only consist of foliage or something of a similar nature, for it is difficult to think of anything else that would allow the light to pass below and through it as does the shadow (!) in question. But even from a great distance, the shadow of foliage would have form, and though its edge might be diffused, it would be recognisable as such.

Its tone too, apart from the nimbus round the edges and any differences that might arise through differences in the texture and value of the surface on which it fell, would be even and of practically the same value as the shadows of the child and wall lower down. That is to say that the mass of the shadow would be even once

PICTURES by Novices

SOME CRITICAL COMMENTS *on the Beginners' prints reproduced on the opposite page*

"SUMMER EVENING," by C. Colles—No. 1 of the prints reproduced on the opposite page—is rather a difficult subject to handle, partly on account of its strong contrasts and partly because of the more or less geometrical character of the shapes it includes.

Straight Lines and Curves.

The two bridges produce a series of curves and straight lines. The river bank is a straight line also, but is on the slant, as is, again, the line of the paving coming in on the left. In the distance are the gracious and rounded curves of trees and their foliage, while the line of the bank, which might otherwise have been somewhat assertive, is broken at irregular intervals by the presence of figures.

Those in the distance, except for the suggestion of life and animation they help to create, are not very material. Those between the centre and the right-hand edge are much more significant, and apart from the one on the extreme right, are admirably spaced and placed in the picture space. That right-hand figure, I feel, would be better omitted. He is a bit too near the edge to assume the role of chief item, yet on account of his proximity he overweighs the next two, which by their position would be better calculated to fulfil this function.

If he were out of the way, the other two would be enabled to attract and hold the attention and would form a good and efficient centre of interest; but, unfortunately, he *was* there, and judging from his attitude and occupation, would seem to be set for a century. There was therefore no alternative but to include him.

Spacing and Placing.

In such circumstances, I think I should have been inclined to make him the chief feature, and by directing the camera more to the right, would have swung him over so that he were placed just about in the same position in the picture as are the two boys next to him.

He would then fall upon one of the strong points of a picture—one of the points of intersection formed by vertical and horizontal divisions of

thirds—in which event he would make a forceful note of attraction that would hold the arrangement together.

The present arrangement of line, which falls quite happily, would not be greatly affected, and taking it all round the revision in the composition would be a considerable improvement.

The sky, perhaps, is rather devoid of tone, but having regard to the conjunction of the shadow side of the bridge against it, it would seem extremely bright in nature, and the present rendering could scarcely be said to conflict with realism, nor do the contrasts, strong though they be, seem excessive. The print therefore conveys the impression of being well handled, and the only point that calls for mention is that with the great weight of tone in the upper portion, a foreground shadow to provide something in the nature of a balance would be useful.

With No. 7, "Mon Realle," by Miss I. M. Ker, such a shadow happens to occur, and with it as an example the effect of a strong dark across the foreground of No. 1 can be imagined.

Vertical Distortion.

"Mon Realle" suffers, however, from a distortion of the vertical lines—they converge towards the top—and also from the fact that part of the arches of the foreground are not included on the right-hand side.

The convergence of the perpendicular lines is attributable to the camera having been tilted upwards, and while this may be unavoidable with the modern camera not fitted with a rising front, I should prefer not to show a contact print, but would put the negative in the enlarging lantern and correct the lines by tilting either the negative or easel, or both.

As far as the inclusion of the arch on the right is concerned, I suspect that there was not sufficient room to get far enough back to include much more, and there was no alternative but to take the thing as it was or to leave it alone. That is, of course, assuming that the camera was of the ordinary folding type without provision for the interchange of lenses. With the "field" or "universal" type of instrument and a short-focus lens, it would be a comparatively simple

matter; but on account of their bulk and weight, cameras of these descriptions are not very popular to-day.

Awkward Subjects.

The folding camera, no doubt, is a good compromise and admirably adapted to tackle the majority of subjects the amateur is likely to encounter; but for awkward subjects like this and No. 6 there is nothing so efficient as the older type.

No. 6, "Gate of Honour," by B. L. Lord, would probably have been more successful had it been taken as a vertical instead of a horizontal picture.

The fact that the base of the archway is missing makes the subject seem lacking in stability, and there is just the possibility that it might have been included had the subject been taken the other way. If not, this again is a case where the field camera would be needed to do the job in proper fashion.

Nos. 3 and 4, "Hastings," by D. F. Luck, and "Pleasant Corner," by F. Watson, are akin in the choice of subject, both dealing with a set of steps. I rather like the latter the better, possibly because that print is stronger than the other and shows a fuller range of gradation; but it could do with a bit more foreground, while the other would be better designed if a quarter of an inch were removed from the base.

The Shadowed Foreground.

No. 5, "Roque Nublo," by C. H. Bartlett, is interesting as it shows how the delicacy of the distance is enhanced by a weight of tone in the foreground.

It is true that the latter might be better disposed, and that the inclusion of something in the nature of a middle distance would be helpful; but in the absence of a knowledge of the neighbourhood it is impossible to say whether it could have been obtained or not. The sky, too, is lacking in gradation, and if a sky like that of No. 2, "Skydros," by E. M. Bailey, could have been incorporated, the rendering would have been much more attractive.

No. 2 shows a good arrangement of trees, and their form is displayed to advantage; but here again a shadowed foreground would prove a decided advantage. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

THE WORD "SOFT" IN PHOTOGRAPHY.

A LETTER from a reader has been handed to me in which he says that he has not seen an article in this paper explaining the various meanings of the word "soft" in photography. He says he knows what is meant by a soft lens, but what are a soft developer, a soft bromide paper and a soft plate emulsion?

I have explained these things from time to time, but as the explanations have appeared in these beginners' notes, that is probably the reason why this reader, and others, have never seen them. When a word has acquired a definite meaning in a certain connection, it naturally comes to be used in that connection without explanation. Doubt as to the significance of a word is often quite excusable, though, as the same word is made to do duty for many meanings. Most of us would rather be credited with a soft heart than with a soft head; and the word has different connotations when we speak of a soft roe, a soft drink, a soft wind, soft music and soft soap.

Fig. 1.

If we say that a bromide print is "soft," what do we mean? The general idea is that it is delicate in its tones; various greys predominate, and the darkest of them may be far short of the darkest tone a paper can be made to give.

Fig. 1 is from a "soft" print; Fig. 2 is from a "hard" one. I have borrowed all the four prints reproduced, and I hope to be forgiven if I say that I do not think that any one of the four is what it ought to be. Fig. 1 is softer, or weaker, in its tones than the reproduction suggests; Fig. 2 is mostly jet black, nothing like what we see even on the darkest night, and other parts are blank white paper.

The title of Fig. 3 is "Daybreak," and the subject was probably soft, delicate, almost dainty to the eye. The print is by no means as pleasing as the reproduction; it is not only "soft," but muddy, foggy and degraded. The reproduction gives a very fair idea of a "soft" rendering.

Fig. 4, taken in bright sunlight, is hard—too hard. The shadows lack transparency; the sky and other parts are blank paper.

Whether a print is hard or soft, and of course it may be neither, depends on several things: the contrast of the original subject; the contrast of the negative, depending on the kind of emulsion, and on exposure and development; and the kind of paper used for making the print.

What is a soft emulsion? It is one that makes it possible, with suitable procedure, to produce a negative full of detail, but without great contrast. This was explained and illustrated in these notes not long ago.

And a soft developer? This is a solution that brings out a detailed image quickly, but builds up density and contrast slowly. It has, as it is said, a high development factor. With such a developer, and a soft emulsion plate, it is easy to produce a negative full of detail, but with great density even in the parts representing the highest lights of the subject.

Fig. 2.

Announcing
The NEW
SIX-20 DUO-"KODAK"

Always a favourite because of its compactness, precision mechanism, the Duo has now been given the following improvements, putting it even more to the front of the 'thoroughbred' class.

1. Built-in shutter release on the body of the camera.
2. 'Single-touch' closing mechanism.
3. Beautiful matt chromium finish.
4. Built-in holder for Kodak Pocket Range-Finder.
5. Improved disc-type winding key with milled edge.
6. Improved locking catch for camera back—still more secure.
7. Side struts of improved design—neater, smarter.
8. New carrying case.

The new Duo is now available at the following prices:—

With

Kodak Anastigmat f4.5 lens and 4-speed Kodak Shutter	... £7.10
Kodak Anastigmat f4.5 lens and Compur Shutter	... £8.17.6
Kodak Anastigmat f3.5 lens and Compur Shutter	... £10.10.0
Zeiss Tessar f3.5 lens and Compur Shutter	... £13.10.0

Ask your Dealer to let you see the new Duo, or write to Mr. A. P. Taylor, Dept. 57B,

The advantages of

"Dufaycolor is the most perfect system of additive colour photography yet devised in that it combines the following improvements over all previous processes:

1. Considerable increase in speed, permitting snapshot exposures with ordinary inexpensive cameras under a wide range of conditions.
2. Greater latitude in exposure.
3. Finer and very much less obtrusive colour screen elements.
4. Absence of frilling and blistering.
5. Absence of parallax.
6. Ease with which three-colour separation negatives can be made for preparing colour photographs or colour blocks for machine printing by any process. Monochrome negatives can be made, and from them black and white prints either by contact or by enlargement.
7. Ability to make duplicate transparencies without serious loss of colour."

This is an extract from the Dufaycolor Book which, in addition to a complete description of the process has special sections devoted to:—THE AMATEUR PHOTOGRAPHER; THE MINIATURE CAMERA USER; THE AMATEUR CINEMATOPHOTOGRAPHER; PORTRAIT PHOTOGRAPHY; COMMERCIAL WORKS and PRESS PHOTOGRAPHY; TECHNICAL, SCIENTIFIC and CLINICAL PHOTOGRAPHY. Readers of Amateur Photographer are invited to apply for a copy of this book (post free 8d.) to Dufay-Chromex Limited, 14-16, Cockspur Street, London, S.W.1.

ROBOT

'THE CAMERA THAT THINKS FOR YOU'

ROBOT in name—and action, that's where the Robot is the **different** miniature, for loaded—a few turns of its knurled screw and it leaves your mind free to get your pictures. You can 'shoot' at 4 a second—never a possibility of double exposure, Robot automatically winds on. Its 'zone' focussing gives needle-sharp definition every time.

COLOUR WORK——JUST WHEN OCCASION ARISES

A special subject—and you can change your film—you can put colour films in to-day, go back to 'pan' to-morrow—with the loss of only 2 frames. That's only a few ROBOT advantages—there are more.

Write to-day for full
details—see below.

53 & 54, HAYMARKET
LONDON . . S.W.1
Telephone: WHitehall 2662-3.

Fig. 3.

This is a "soft" negative, and will give a soft print on a suitable type and grade of paper. But a paper may be used that has what is called a low exposure scale—a "vigorous" paper—and we can get a hard print from a soft negative. All the four prints reproduced could be enormously modified by using different papers with the same negatives.

The reader also asks whether he will lose *definition* if he uses a soft plate, or a soft developer, or both. They do not affect definition at all. This is a different thing alto-

gether from strength and contrast of tone.

Finally, he says, "A soft bromide paper is supposed to have a longer tonal scale than a normal paper, yet we are told that a 'perfect' negative should be printed on a normal paper. Why should we lose the advantage of the additional tonal range?"

A soft paper cannot do more than range from white paper to the deepest black that a silver deposit can give, and other grades can do this as well. The only meaning of a "perfect" negative is one that will serve its required purpose exactly. As these purposes vary enormously, negatives must also vary in character. For a black-and-white reproduction, we use a Process plate and a vigorous paper; for a portrait we may require both a soft negative and a soft paper.

Fig. 4.

SOME NOTES ON FILM PACKS

THE outstanding advantages of film packs in the matter of convenience in use render them very popular in spite of their comparatively high cost. One of these advantages is that it is possible to change the film and be ready for a second exposure very much more quickly than when using either roll film or plates, always excepting, of course, those *de luxe* roll-film cameras in which a completely automatic winding device is incorporated. And film packs have the further desirable feature that exposed films can be withdrawn for development without disturbing those as yet unexposed.

The modern photographer has no cause for complaint at the variety or perfection of the material provided in this form. The films supplied by the leading makers range from the slow-speed ortho to the super rapid or fine-grain panchromatic. It is a good plan to provide two film-pack adapters, one containing a slow ortho or 'chrome film, and the other one of the fast panchromatic variety for special subjects.

With some film-pack adapters of older types troubles occur when the pack is held so tightly that it has to be forced into place, with the result that it admits light. Others hold the pack so loosely that the negatives are not in register, and poor definition results. This will also be found to occur when the pack fits too tightly, so forcing the film surface out of the focal plane. These troubles, however, seldom occur with

the adapters fitted to modern cameras.

The photographer also has to exercise care in the way in which he holds the pack itself. The safety cover of the pack should not be touched when loading it into the adapter. If this is done there is risk of light creeping in, with the certainty of fogged negatives. For the same reason the pack must not be bent or twisted in any way.

While the film pack is intended for daylight loading, it is best to conduct the operation in subdued light, and never in direct sunlight. This is very necessary in the case of high-speed panchromatic films.

It is necessary to protect film packs from prolonged exposure to light both before and after exposure. In the latter case the pack should be wrapped up in its original packing and not left exposed to light.

In the Dark-room.

It is admitted that in dish development of film-pack negatives there is more risk of scratching the surfaces or causing other damage of a mechanical nature, than is the case with plates or roll film.

Most of the troubles with regard to mechanical damage are the result of attempting to develop too many films in the dish at one time. Not more than four films should be dealt with at a time, and two will be better if complete freedom from damage is desired.

A deep dish and plenty of developing

solution are necessary. Remove the films from the pack (in the dark-room, of course), and after tearing off the black paper from each film place it in a dish of cold water to soak. See that the films do not stick to the bottom of the dish, or to each other, and keep the dish covered. The films can be removed from the water one at a time and transferred to the dish of developer.

In the case of panchromatic films the pack is opened in the dark and desensitiser may take the place of the water; the films are allowed to remain in the solution until required for development.

Using a larger dish of, say, half-plate size for $3\frac{1}{2} \times 2\frac{1}{2}$ films, one film is placed at each side of the dish, and rocking done in the opposite direction. This will lessen the risk of one film sliding over the other, and scratching the soft surface.

Fixing is best done in an acid fixing bath, which has a hardening effect on the gelatine-coated back of the film as well as the emulsion side.

Tank development is the ideal method of processing film-pack exposures. It is quite an easy matter to load a well-designed tank in the dark, and all risk of mechanical damage is avoided. The black paper should be removed before placing the films in the tank, and after the tank is loaded and the developer poured in, the lid is replaced and the remaining operations conducted with the light turned on as with ordinary tank development of roll films. R.M.F.

MAKING BETTER SNAPSHOTS-5

By DAVID CHARLES.

This article is the fifth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. A seaside snapshot in which the high viewpoint isolates the figures from their background.

THE photographer who made Fig. 1 was quite evidently bent on securing a photograph of the two children. Whether of set purpose or by accident he used a high viewpoint, which gave him the advantage that the heads of both children are clearly outlined against a simple and clear background, whereas had he been standing on the beach towards which his models were walking, their heads would have been mixed up with the jumble of shipping above.

But this is almost its only virtue as a seaside portrait. Focussing was forgotten, so that the faces are less sharp than their background, and both children are much too evidently standing "for a portrait."

Fig. 4. The horizontal line of the bank breaks this picture into two parts.

Supposing the photographer had first of all got his camera properly set, and then noted the particular patch of shingle on which the children were standing. Next he sends them back into the water, with instructions to turn round and trot towards him. At the instant that their feet reach the predetermined spot, he shoots. He might want to try two or three shots, but the selected one would be worth ten thousand of the present example.

It cannot be denied that the top half of the print is filled far more interestingly than if it had been mainly

Fig. 2. The children are more interesting with the shipping left out.

such a division, though in this particular case the small amount of subject included below the dividing line will hardly make up into a picture by itself.

This feeling of separation between the upper and lower portions of a single photograph is not really difficult to avoid. Save in exceptional cases, the division is hardly more than suggested, and though the suggestion is quite often strong enough to destroy any feeling of unity that the picture would otherwise possess, it is also weak enough to be completely overcome by any

strongly-marked line, such as that of a tree or figure in the foreground, running across it as in Fig. 5.

Fig. 5. But here the inclusion of the tree is sufficient to break the insistent line of the river bank.

Fig. 3. And the shipping, included more or less by accident, makes a better picture by itself than do the children for whose sake the exposure was made.

sky. But it did not occur to the author of this photograph that not only is this upper portion a quite interesting subject in itself, but it is entirely separated off by a dividing line. It is, in fact, a much nearer approach to a pictorial result than that of the subject aimed at.

The "split-across" pictures are fairly common. Wherever there is a bank to the river or a bridge across it, broadside on, or nearly so, to the camera; whenever a clean-cut horizon divides the sky from the sea or the open heath, there is the danger, that such a definite line will divide a picture into two separate sections of interest.

In Fig. 4, for example, there is just

"Make up" your own CHEMICAL FORMULÆ

By G. K. SEAGER.

THE amateur who is taking his hobby of photography seriously misses a lot of fun if he never makes up his own developers and other solutions. Apart from the interest and knowledge it imparts, it is much cheaper than buying ready-made solutions.

Scales and weights are necessary, and these can be obtained quite cheaply from any good dealer. Chemicals, the names of which are given in the formulæ supplied with the films, are also obtainable in reasonably small quantities, usually in 1-oz. bottles.

In order to ensure accuracy it is necessary that the scales should balance correctly, in weighing the chemicals. Stood on a level bench, a piece of paper should be placed on each pan, and not only on the one used for chemicals (see Fig. 1). These papers should be of equal size and thickness, and a small note-pad forms a suitable supply of uniform pieces.

Moreover, one should not, in weighing chemicals, do what some people think the grocer does, namely, make the scale *weigh down* with the substance being measured. The scales should just balance, and a great help to accurate weighing without spilling expensive chemicals is a long mustard-spoon,

Fig. 1.

The city dweller might think it pernicky to filter his developing solutions. But it is not only in the Tropics that impurities are found in the water supply, as a trial will soon demonstrate. Ordinary impurity in this country does no real harm, except that it is liable to adhere to the gelatine film and cause spots or smears on prints.

The man who goes in for enlarging to a good many diameters, and actually anyone who takes a pride in the perfection of his work, is recommended to try filtering at least his developer for miniature negatives, after dissolving the chemicals. By far the best way to do this is to pour the solution into a funnel to which a filter-paper has been fitted. Packets of these filter-papers (circular in form) can be had from any large drug-store quite cheaply, and each one should be thrown away after use. To get the filter-paper to a cone, fold it double, twice, as in Fig. 4. An important advantage of filtering is that it removes from the solution any undissolved particles.

Fig. 2.

contact with hypo and similar substances, which are quite good friends so long as they are kept in their places, but can be dangerous enemies if allowed to take liberties.

To help prevent chance of trouble of this kind, it is not at all a bad plan never to lay down the little spoon, but to wipe it with a spare piece of paper, and then to stand it up, by the aid of a rubber band around its bottle, as shown in Fig. 3.

In this connection perhaps you may have noticed, when your chemist is handling bottles of solutions, that he never, when taking out a cork or a stopper, lays it down on the counter. A chemist always extracts a cork with some of his less important fingers, and continues to hold it between them while he completes the operation of pouring, measuring, etc., when he puts it back the same way. So there is not the least chance of that cork or stopper picking up stray particles of other chemicals which may have been spilled. It is a habit quite easy to acquire, and one which certainly helps to spell safety to the delicate chemical process of developing silver images. You can see the idea in Fig. 2.

Fig. 4.

Fig. 3.

made narrow enough to enter the mouth of a small bottle by a couple of minutes work with a file (see Fig. 2).

When such a very small quantity of chemical is going to do such a lot of important work, it is advisable to ensure that no trace of adulteration can get into it. So all utensils should be well cleaned, and the little spoon especially should not be laid down where it may come into

METALLIC PHOTOGRAPHS

An Interesting Experiment

By
R. H. KELSEY.

METALLIC prints may be made from any good clear negative by the following method, instructions for which are given below. There is no danger attached to the job, owing to the non-poisonous nature of the chemicals in use.

This experiment is both interesting and useful. No expensive apparatus is required, and the chemicals can be bought for a few pence from any chemist, these being as follows:—

Ferric ammonium citrate (otherwise known as iron and ammonia citrate).

Ferric chloride.

Citric acid.

A small test tube, stirring rod, and some pieces of glass; old negatives which have been thoroughly cleaned will do.

Boil about a teaspoonful of water in the test-tube, and while it is boiling drop a pinch of the ferric ammonium citrate into it, stirring the while to prevent settlement on the bottom of the tube. When dissolved, add a weak

solution of citric acid (this is made by dissolving as much as will lie on a threepenny piece, in an eggcupful of hot water); add this to the mixture drop by drop until there are six or eight drops in the tube.

Make a solution of ferric chloride, using the same quantity as above, but only using half the amount of hot water. Of this add about 10 drops to the mixture in the tube and boil the whole for about a quarter of a minute; at the same time drop in another couple of pinches of the ferric ammonium citrate and keep stirring, and when all is dissolved stand the tube aside to cool.

Now take a piece of the clean glass and pour a little of the solution into the centre and turn the glass about so as to let it spread evenly over the surface, then allow the surplus to drain off, and stand it aside to dry. If, however, a more even surface is required, the solutioned plate had better be placed on a whirler for a second or so, after which the plate

may be removed and placed in a box, or laid flat down in a warm (*not hot*) oven, to dry.

To expose the plate place it under a good strong negative in a printing-frame or clip the two plates together with rubber bands and expose to a bright light (sunlight for preference) for about fifteen to twenty minutes.

Remove the sensitised plate from the frame and develop by dusting over the surface (with a fine camel-hair mop or a tuft of cotton-wool) some fine bronze or gold powder. The surplus can be blown off, or swept off with the mop.

To fix the print pour a small quantity of good clear celluloid varnish over it quickly and allow to set hard.

To transfer the metallic print to card or paper place the plate in a saucer of water and the film will float on the surface and can be picked up and placed on the card with a fairly wide knife.

Combined development and fixation is the subject of a recent Austrian patent. The necessary solution, in which the concentration of hypo is only 4 per cent, is made strongly alkaline with a mixture of caustic soda and ammonia to accelerate development, and is preserved from the rapid deterioration that so energetic and alkaline a developer would otherwise undergo, by the addition of grape sugar. The formula given by Ernst Fournes and Hans Diamant-Eerde, the inventors, is reproduced here in case any reader would like to experiment with development and fixation in a single operation. Metol, 96 grs. (10 grm.); Hydroquinone, 38 grs. (4 grm.); Sodium sulphite (anhyd.), 310 grs. (32 grm.); Hypo, 385 grs. (40 grm.); Caustic soda, 192 grs. (20 grm.); Ammonia .880, 96 minims (10 c.c.); Grape sugar, 290 grs. (30 grm.); Water to 20 oz. (1,000 c.c.).

The bi-monthly magazine, "Filmo Topics," published by the Bell and Howell Company at 1801-1815, Larchmont Avenue, Chicago, U.S.A., now appears in a new dress. It is much more fully illustrated than formerly, and the pictures are of a kind likely to be very helpful to the amateur cinematographer, no matter what make of apparatus he uses. Users of ciné cameras will receive copies of this magazine, without charge, as it is published if they apply to the above address, giving the make and model of camera and projector used, and, in the case of Bell and Howell instruments, quoting the serial numbers.

"The Path to Trouble Free Photography" is the title of a pocketable little book, amusingly illustrated, which we have just received from Zeiss Ikon Ltd. This little booklet of 31 pages makes interesting reading, and gives many hints for the not so experienced photographer. At the back of the book there are developing formulae, and also a very useful exposure guide. Copies of this publication will be sent free to readers of "The A.P." upon application to Messrs. Zeiss Ikon Ltd., Mortimer House, 37/41, Mortimer Street, W.1.

Four new brochures dealing with just the various Voigtlander cameras have been published. One describes both the ordinary and range-finder models of the Bessa camera, which readers will remember as the first popular-priced camera to be fitted with a shutter release on the camera body. A second pamphlet is entirely devoted to the Rangefinder Bessa and its accessories. A third describes the Superb, a twin-lens reflex camera focussing to 2 ft. 8 in., and providing complete parallax compensation, both on the focussing screen and in the frame finder, even to this very near distance. The remaining brochure deals with the Brilliant, a twin-lens camera in which the upper lens is that of a very large and brilliant non-focussing viewfinder. Any or all of these booklets may be had from dealers, or copies will be sent post free by Messrs. Schering Ltd., 188-192, High Holborn W.C.1, to any applicant who mentions *The Amateur Photographer*.

Pathescope, Ltd., North Circular Road, Cricklewood, announce that the full Coronation film, including a sequence of the Crowning of His Majesty, will shortly be available in 17.5-mm. size for the Pathescope Talkie, length 500 ft. The price will be £5 per copy.

Miniature camera users will all be keenly interested in the claims made for the "Champlin No. 15" fine-grain developer, the formula for which is published for the first time in the new book "Champlin on Fine Grain." This book discusses the question of fine-grain development, especially in its relation to film speed, with considerable thoroughness, and gives in some detail the course of the author's experiments in investigating fine-grain development. His use of salicylic acid as an accelerator, combined with benzoic acid as a hardener of the gelatine and boric acid as a buffer, and of pyrogallol as a stain producer in conjunction with tannic acid as a mordant, is distinctly original, while the addition of a nickel salt to enable minimum exposures to be given may mark a definite step forward in development technique. For his final formula, No. 15, the author claims that while it gives grain as fine as that given by the Sease III fine-grain developer, which requires between three and four times normal exposure, with his formula exposures can be reduced to half. The book can be obtained through any bookseller at 8s. 6d., or direct from the Fountain Press, Ltd., 19, Cursitor Street, E.C.4, for 8s. 11d., post free.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Make Use of Sound

By
S. E. L. M.

THE addition of sound at least doubles the worth of any well-made silent film. The film becomes twice as good . . . which is just another way of saying that all films silently shown are only half as good as they might be.

Yet, for reasons which I will presently disclose, we should not give up making these silent films. The fact that the phenomenal change-over experienced in professional circles has found no reflection in our amateur movement indicates only that their technical processes have not yet been successfully adapted to sub-standard sizes. Immediately they have been, sound will sweep through the amateur world like an avalanche.

But it is not certain that sound will come like that. There are now signs of despair in the laboratories where numerous adaptations have been investigated. Theoretically-safe ideas, manipulated in practice by expert hands, have frequently failed. Expert cameramen have blamed their expert chemists—and expert chemists have blamed their expert cameramen. That is the trouble about all theoretically-safe ideas.

Disc Recording.

Whilst the sound-on-film people have not yet evolved the perfect amateur process, practical direct recording on a disc durable for two hundred playings has now been achieved and made available for all amateur cinematographers. The process made thus available is known as the "Simplat" and will be fully announced at a later date. From the specimen discs I have examined, however, it is apparent that the process preserves a wide range of musical tones and is unusually good on speech recording. I understand that the results are quite consistent in quality and that arrangements have been made for the supply of a home-recording instrument (retailing at about £40).

Large-sized discs for recording cost from 4s. to 6s. each. They are very quickly available for use upon ordinary gramophones and with ordinary needles, simple treatment only with a hardening solution being advisable before the first playing. In point of fact, the discs are practically unbreakable, and are altogether harder than the familiar gramophone wax records.

Substitutes.

Let there be no doubt now as to the desirability for continuing to shoot at silent speeds. Even where no attempt is made to marry the shooting scenario with a prepared sound script, the important benefit referred to at the

beginning of this article can assuredly be enjoyed.

The essential thing now is to put the most effective sound on to your discs or to prepare substitute accompaniments from existing stocks of gramophone records. In the case of these substitutes, it does not necessarily follow that the absence of speech is going to retard actual expression; rather is it true to say that music alone often helps to express the otherwise inexpressible.

Reproduction.

The best method of reproduction relies upon the use of an electric gramophone (or amplifying speaker unit) fitted with a double turntable. Other methods are, of course, usually better than none at all—in which connection one should always investigate the possibilities of playing through an ordinary wireless set.

The reproduction will not be entirely successful unless it be *effective*, and to achieve this end the instrument should be provided with some means for controlling the output or volume of sound.

It is also necessary to arrange the records in proper order for playing, a detailed "score" for every film possessed being most useful in the simplification of this.

Where selected parts only of a record have to be played, I have found it helpful to "mask" the unwanted parts with parchment quoits and discs. These should be attached, by means of rubber solution, to the blank surfaces only of the records. Records of which selections are required from both sides, together with any that are to be played more than once in a programme, should always be bought in duplicate. This saves much time and possible confusion.

Finally, learn to regard breaks in the sound accompaniment as you would regard breaks in the film itself. You can just as easily fade sound into sound as you can fade image into image. But this is not to ignore the value of silence, for in the suspense of a dramatic moment even the dropping of a pin can wreck the tight-stretched, tensile atmosphere.

Which is not just another way of saying that all films silently shown are only half as good as they might be.

A good example of a subject that is spoilt as a "still" by the busy background, but becomes effective and successful when action is introduced. The diving figure is then entirely separated from the surroundings.

Before Making a Story Film

By "ACTINOGRAPHER."

WHEN you have made a family film, finished a few news-reels and dabbled in the different kinds of documentary, you may be forgiven if your thoughts turn to the making of a playfilm.

Looking at the task superficially, you will imagine that it is going to be easy—for the story or narrative content is surely able to hold the attention of an audience to the very end (plainly enough, a welcome change from your non-story efforts, in which every device of filmic persuasion has to be used in order to cajole audiences into keeping their eyes fixed on the screen).

Against this, however, you will shortly discover that shot continuity—the gold and platinum of documentary work—is extremely more difficult to handle. Much of that clever editing which is all too well admired in the interest films is really not so elusive; it is only when you take a narrative and build your film on to it that shot continuity emerges as a device which more often than not requires long lapses into documentary treatment. . . . And to admit of these, in a photoplay, is merely to apply the brakes before you get to the top of the hill.

Images and Other Things.

To overcome this difficulty, you must draft out your scenario in terms of action—not of carefully-selected words. For it is action (and not literary phrases) that you have to film. Progressing only a step farther you will spot the obvious fact that your film will consist of a succession of *images*; and images are created more readily from the idea of action than they are from polished words.

Now, as an intelligent amateur, you

will not care to waste film on an imbecile "pot-boiler." You will want something new—or, what is almost the same thing, something sensible. Then run a critical eye over some of the average playfilms. Seek the cause of their mild mediocrity. Is it not a fact that their duplicated themes ("boy gets the girl," "private sleuth gets the crook," and "gushing gigolo gets it in the neck") are all too trivial to make up into really noble films?

Then turn to something big. Thousands of hungry farmers are settled on land of their own, and make "Mr. Deeds," the greatest film of its year. Tyrannised sailors get food instead of lashes—and "Mutiny on the Bounty" secures another leading place.

Turning to possibilities, I know you don't possess an army of farmers—nor yet even the hulk of an old-time man-o'-war; but that does not compel you to disguise gentle grandpa as a gunman or to offer Aunt Amelia the part of an Indian squaw. No; your possibilities and your opportunities lie in the living problems of Tooting, of Stepney, of Mayfair, of the flooded Fenland, of the arterial and busy roads.

Problems of the past hold a wealth of noble material, too, especially where they deal with important social and humane themes. And any of these may be tackled provided you have access to the necessary amenities.

Characters.

When it comes to selecting a story film, your first choice will naturally be restricted by the number and ability of those who are prepared to act in it. Even the U.S.S.R. studios, which originated the idea of types (and turned ordinary people into one-film "stars"

overnight, as it were), have long since reverted to the employment of trained players. But there is no denying the success of that earlier idea; and much great work done in the Irish amateur film, "Dawn," shows that untrained players are quite satisfactory in any production which is good enough of itself to dispense with the charm and mannerisms of gifted personalities.

So, on the score of that, you have possibilities enough. But take care that your parts are cast for real people. Wherever possible, your "actors" must thoroughly understand the parts they have to play. Your film gardener can be the man who prunes the Madame Butterflies every year for the fellow in the big house at the corner; your bus conductor may be the chap who collected your twopence every morning until you discovered how good it was to walk. And almost every other part you are likely to handle can be similarly filled by at least one of your everyday acquaintances.

Finally, remember that the box-office and other hampering interests do not control the amateur film. It need not and should not be divorced from truth. Its story should be convincing—of things as they are. Its characters and episodes should appear on the screen like the reflections of real people and real objects in a perfect mirror.

Maybe that seems too simple a formula to warrant success. Yet its observance has resulted in all the great films of amateur and professional endeavour. . . . The fact that there are many bad films in existence is only evidence of the same neglect which leads people to cross the road without first taking the trouble to look about them.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, July 7th.

Armley and Wortley P.S. Ramble. Whitkirk and Templenewsam. Luton and D.C.C. Meeting.
Sinclair P.C. "Ordinary Chrome and Panchromatic Photography."
Solihiull P.S. "Exposure: and the Matching of Paper to Negative."
Windlesham C.C. "Composition." M. O. Dell.
Worthing C.C. Outing to Arundel.

Thursday, July 8th.

Bedford C.C. Cambridge or Ely.
Cambswell C.C. "Some Masterpieces of Photography."
Hampshire House P.S. "Chloro-Bromide Printing." S. I. Ellick.
Nottingham and Notts P.S. Hawton Church. J. C. Stanger.
Oldham P.S. Evening Ramble—Denshaw to Castleshaw.
S. Suburban and Catford P.S. Outing to Tonbridge. H. Colebrook.

Saturday, July 10th.

Accrington C.C. Helmsore to Ramsbottom.
Aston P.S. Kenilworth. M.C.P.F. Outing.
Bath P.S. St. Catherine's Court. H. W. Willmer.
Blackpool and Fylde P.S. Lancaster. H. D. Keighley.
Halifax P.S. Ramble to Crimsworth Dene.
Hanley P.S. Roches. W. Sheard.
Hull P.S. Barton. L. Vokes.

Saturday, July 10th (contd.).

Leicester and Leicestershire P.S. Kenilworth Castle.
North-West London C.C. A Visit to the London Zoo.
Oldham Equitable P.S. Mechanics' Yearly Day.
Scarborough A.P. and Ciné C. Wrench Green to Ayton.
South London P.S. Bradfield. S. M. Davy.
Southampton C.C. Outing with Portsmouth C.C. to St. Cross, Winchester.
Stockport P.S. Combs Reservoir. J. A. Berry.

Sunday, July 11th.

S. Suburban and Catford P.S. Combined Outing with Medway P.S.
Windlesham C.C. Compton Ramble. H. H. Muller.

Monday, July 12th.

Oldham Equitable P.S. Saddleworth Ramble.
Southampton C.C. Evening Outing to Docks.
Walthamstow and D.P.S. Print Competition—Portraiture.

Tuesday, July 13th.

Halifax P.S. "Tank Development." R. A. Hamer.
Leicester and Leicestershire P.S. Exhibition of W. H. Hadley's Pictures.
Manchester A.P.S. Flashlight Photography.
Windlesham C.C. Major North's Invitation Evening.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

CAMERAS "AS NEW."

SIR,—As a frequent snapper-up of unconsidered trifles from your invaluable advertisement columns, may I beg private advertisers of second-hand apparatus to describe their wares correctly?

Attracted recently by the description of a camera "in new condition," I learned eventually that it was faulty in at least one particular, and at least third-hand! My suggestion to the seller that the makers should be asked to examine the camera and to give an estimate, if necessary, to put it "in new condition," their charges to come off the price asked, was rejected.

Of course, your admirable deposit system which I always use, guards both buyer and seller; but such a lot of letter and parcel postage, to say nothing of temper, might be saved by a correct description in the first place.—Yours, etc.,
"AUTOLICUS."

BORROWING PHOTOGRAPHIC BOOKS.

SIR,—In your reply to "L. A. L. (Ware)" in June 23rd issue of "The A.P." you state that "the borrowing of photographic books from libraries is out of the question!" For the sake of saving your correspondent from a great disappointment, I should like you to draw his attention to the services given by the National Central Library and the Regional Library Bureau, which operate through the County and Municipal Libraries.

I am not sure of the full details of the scheme, or of the extent of its availability, but any resident in the area of the Devon County Library at least can obtain almost any desired book, those over 8/- in value which are not in the D.C.L. are obtained from either the Regional or National Libraries, and are loaned for one month. Sometimes one has to wait a few weeks, and again one may receive a work on some technical subject by an author other than the one selected. But the service is a valuable one, and I would advise anyone who wishes to consult expensive works to try first of all at his local library. What applies to Devon is probably available elsewhere.—Yours, etc.,
R. W. J. NORTON.

SIR,—In the issue of June 23rd a reader asked if it is possible to borrow photographic books for reference from a library.

I have been obtaining books for the past few years from the Derbyshire County Library. In addition to the usual fiction they have a students' section from which I have borrowed several books on photography; to name a few:—

Photograms of the Year (7/6); Goodsall's "Pictorial Photography for Amateurs" (5/-); Williams' "Illustrated Photography in Advertising" (17/6); Wall's "Dictionary of Photography" (7/6); Clerc's "Photography, Theory and Practice" (35/-); Lambert's "Studio Portrait Lighting" (15/-); Johnson's "Art of Retouching Photographic Negatives" (12/6), etc., and also books on miniature cameras, all obtained free of any cost.

Three books may be borrowed at a time for one month, and can either be selected at the library by the borrower or may be obtained by post, the library paying the outgoing postage, the reader paying return postage.

The library is a member of the East Midlands Regional Library Bureau, and books not in stock may be obtained through this source. The stock of the National Central Library and other important libraries can also be drawn upon, so there is an excellent chance of the reader being able to obtain any book he might require; in fact, I have never yet asked for a book which they have not obtained for me, in some instances straight from the publishers.

Hoping your correspondent may be able to borrow books in the same way in his town.—Yours, etc.,
H. CAUGHEY.

"THE FEMALE OF THE SPECIES."

SIR,—Regarding the paragraph in the issue of June 23rd, it is to be hoped that merely because the word "photographess" has been noted in the Oxford Dictionary it will not be regarded as a legitimate English word. In my opinion there is no justification for including a word in a dictionary until it has come into some noticeable degree of use, or is likely to do so, whether as a literary word or as slang. Otherwise a dictionary should include the blunders of usage and meaning by ignoramuses.

It is surely absurd for the O.D. to state that "photographess" means a female photographer just because a solitary writer used it in that sense either in jest (feeble) or ignorance (profound). The word does not mean anything of the kind.

The suffix *-er* is a very common one; and, as the O.D. itself states, it originally meant "one who has to do with." This meaning has been extended in various ways, but fundamentally remains. The suffix indicates a doer, an agent, a person concerned with, and so on; and in the vast majority of cases has no reference to sex. A writ-*er* is one who writes, whether it be a male, female, or a machine. "Type-writer" means all three.

If we extend the "photographess" lunacy to other things connected with photography we must forthwith adopt such words as printess, toness, spottess, trimmess, retouchess, mountess, snappess, enlargess, fakess, exhibitess, and so ad infinitum et ad nauseam.—Yours, etc., W. L. F. WASTELL.

Exhibitions and Competitions

CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, July 31. Rules in the issue of June 30.
The Amateur Photographer Novices' Competition.—Special prizes of supplies of films. Latest date for entries, September 30. Particulars in last week's issue.
Wallace Heaton Competitions. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.
Nuro Competitions.—Cash prizes every month. Special prizes for boys and girls under sixteen. Full particulars obtainable from any photographic dealer, or from Nuro Ltd., Biggleswade, Bedfordshire.
Isle of Man Sixth Annual Amateur Photographic Competition, £300 cash prizes. Open until September 30. (P. A. Clague, Publicity Department, Isle of Man.)
Exhibition of Australian Photographs.—Entrance Hall, Charing Cross Underground Station. Open until July 10.
Polytechnic School of Photography (309, Regent Street, London, W.1). Exhibition of Students' Work. Open, July 13-16, from 10 a.m. to 8 p.m.; July 17, 1 p.m. to 9 p.m.
XXVie Salon International de Photographie de Belgique.—Open, May-October. (M. Julien Lejeune, 70, Av. Van Beelaere, Boitsfort, Brussels.)
Midland Counties Photographic Federation Fourteenth Midland Salon of Photography.—Open, June

12-July 11. (W. M. Robotham, Windy Harbour, Duffield Road, Allestree, Derby.)
Lancaster Art Gallery. Open Photographic Exhibition.—Open, July 10-24. (G. M. Bland, F.S.A. (Curator), Public Library, Market Square, Lancaster.)
Northern Photographic International and Open Exhibition, 1937.—Open, June 19-August 21. (W. Whitehead, 8, Bullroyd Drive, Bradford.)
Eighth Chicago International Salon of Photography.—Open, July 15-September 19. (Alex. J. Krupy, Chicago Camera Club, 137, North Wabash Avenue, Chicago, Illinois, U.S.A.)
XXXIle Salon International d'Art Photographique de Paris.—Open, October 2-17. (Le Secrétaire, Société Française de Photographie et de Cinematographie, 51, Rue de Clichy, Paris (9e).)
I International Exhibition of The Photo-Press and Literature (Jugoslavia).—Entries, July 20; open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Jugoslavia.)
Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Entries, July 30; open, September 11-October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)
46th Toronto Salon of Photography.—Entries, July 31; open, August 27-September 11. (W. H. Hammond, 2, Gould Street, Toronto, Canada.)
3e Internationale Focus Fotosalon, Amsterdam,

Holland.—Entries, July 31; open, September 11-26. (Focus, Ltd., Fotosalon, Bloemendaal, Holland.)
London Salon of Photography.—Entries, September 1; open, September 11-October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)
Anthracite Salon of Photography, Everhart Museum, Scranton, Penna, U.S.A.—Entries, September 7; open, September 18-October 4. (Salon Director, Everhart Museum, Scranton, Penna, U.S.A.)
International Photographic Exhibition, Budapest.—Entries, September 20; open, October. (Modern Magyar Fényképezők, VIII, Rákóczi-ut 19, Budapest, Hungary.)
Fourth Canadian International Salon of Photographic Art.—Entries, before September 10; open, October 23-November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)
Sixth Irish Salon of Photography.—Entries, September 25; open, October 30-November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)
"Irish Travel" Photographic Competition, 1937. Cash prizes.—Entries, September 30. (The General Manager (Photo Competition), Irish Tourist Association, 14, Upper O'Connell Street, Dublin, I.F.S.)
Lincoln C.C. Eleventh Annual Open Exhibition.—Entries, October 1; open, October 20-November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

YOUR HOLIDAY CAMERA

—Choose it and use it **NOW!**

Get it from Sands Hunter's and pay for it a little at a time out of income. Add 5% (1/- in the £) only to the list price. The first instalment is all you have to pay to secure one of these marvellous cameras **NOW.** Write to-day for Hire Purchase Order Form.

12 months to pay !!!

"ROLLEIFLEX"

For 12 exposures 2½ in. square. Brilliant mirror reflex finder. The picture is seen the right way up and same size as print. Automatic film winder. Zeiss f/3.5 Tessar, Compur shutter, 1 to 1/500th sec. Price... £25 0 0
 Rolleicord, a mirror reflex camera which includes a number of Rolleiflex features. Zeiss Triotar f/4.5 £14 10 0
 Zeiss Triotar f/3.5 £16 10 0

THE "KINE-EXAKTA"

A miniature roll-film reflex for 24 × 36 mm. daylight-loading spools of 36 exposures. Focal-plane shutter to 1/1,000th sec. Chromium finish throughout, brilliant focussing screen.
 With Exakta f/3.5 lens... £27 10 0
 With Zeiss f/2.8 lens... £38 10 0
 With Primoplan f/1.9 lens... £45 0 0

THE "PILOT 6"

Although amazingly inexpensive, the Pilot 6 is a real reflex camera in every sense of the word. It takes 12 exposures 2½ in. square. Self-erecting focussing hood with magnifier. Eye-level wire frame finder.

PRICES:

No. 13 Pilot 6, with f/3.5 focussing anastigmat lens... £4 2 6
 No. 14 Pilot 6, with f/4.5 focussing anastigmat lens... £5 5 0
 No. 15 Pilot 6, with f/3.5 focussing anastigmat lens... £7 2 6

THE "CONTAX"

All-metal focal-plane shutter, providing exposures up to 1/1,250th sec. (Open back, easy to load. Daylight loading, 36 exposures.

PRICES:

With Zeiss Tessar f/3.5 lens... £40 10 0
 With Zeiss Tessar f/2.8 lens... £43 5 0
 With Zeiss Sonnar f/2 lens... £50 10 0
 With Zeiss Sonnar f/1.5 lens... £65 15 0

Fully detailed complete catalogues free on application.

SANDS, HUNTER & CO. LTD.

37 Bedford Street Strand London WC2

CINE-KODAK 8-mm. CAMERA

Light and compact. Built-in exposure guide tells you the stop to use whatever the light conditions. Economical to run. Films cost only 10/- for 50 ft., including processing.
 With f/3.5 lens £9 17 6
 With f/1.9 lens £15 0 0

VOIGTLANDER "BESSA"

A new camera with automatic focussing range-finder.

Self-erecting front, eye-level view-finder, complete with light filter. For 8 or 16 exposures on 3½ × 2½ roll films.

With f/3.5 Helomar lens £16 10 0
 With f/3.5 Skopar lens £18 15 0
 With f/3.5 Hellar lens £21 0 0

THE K.W. REFLEX BOX

A self-erecting focussing hood, in conjunction with a surface silvered mirror and a focussing screen of extra fine grain, allows the entire picture to be examined and focussed in the brightest light.

The all-metal slit shutter is adjustable for 1/25th, 1/50th and 1/100th sec., and for brief and long time exposures. Size of picture 3½ × 2½ in.

PRICES:

No. 900 K.W. Reflex Box, with f/5.3 focussing anastigmat lens, rotating stops... £3 13 6
 No. 905 K.W. Reflex Box, with Steinheil Actinar f/4.5 focussing anastigmat lens, with iris diaphragm... £5 5 0

THE "LEICA"

The camera of world-wide repute taking 36 pictures at one loading, shutter speeds 1/20th to 1/500th sec., automatic focussing, chromium plated.

Model II, with range-finder, Elmar f/3.5 lens £27 17 0
 Model III, with range-finder, Elmar f/3.5 lens shutter speeds 1 to 1/500th sec... £31 16 0

IS YOUR CAMERA ONE-EYED?

"Blessed are the one-eyed in the country of the blind"—so said Frederick the Great. Brought down to photographic terms, this means that a camera with one lens is better than no camera at all. But why only one lens? You are limiting the sphere and enjoyment of your hobby. Add at least one additional lens to your standard equipment. If you're interested in architecture or interiors—you'll need a wide-angle lens. If outdoor shots are your forte, then a telephoto lens will give you incomparably better results. Or if you are keen on indoor night photography, you'll need a large-aperture lens. Dallmeyer's make them all—and because over three-quarter of a century's experience goes into every Dallmeyer lens, they are the best. If you can't get the camera you want fitted with a Dallmeyer lens, write us immediately—we shall be glad to help.

Have your camera fitted **NOW** with a

DALLMEYER TELEPHOTO LENS

AND ENJOY BETTER PHOTOGRAPHY

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

In connection with the Robot camera there has just been published a very attractive catalogue illustrated with Robot pictures, among which is a most impressive four-second sequence of twelve photographs of an athlete throwing the hammer. A reduction of an enlargement $3\frac{1}{4}$ feet square is also shown, and the degree of enlargement involved is brought home by the fact that the contact print beside it, reduced in the same ratio, looks like little more than a speck of dirt on the paper. Some details of the very ingenious mechanism of the camera are described, and there is a descriptive list of the various interchangeable lenses and other accessories available for the camera. The catalogue, which is very well produced in photogravure, can be obtained on request from Messrs. Robot Ltd., 53-54, Haymarket, S.W.1.

A new booklet setting forth the attractions of economical cinephotography with a Ciné-Kodak Eight has just appeared. This little booklet, which contains a number of valuable suggestions as to subject-matter for amateur ciné work, includes descriptions and prices of three 8-mm. cameras and three projectors, the complete outfits ranging in price from £19 19s. to £58. With any of these the cost of running works out at about sixpence per scene, which is claimed to be the lowest running cost of any ciné camera in the world. This attractive pamphlet can be obtained free from any photographic dealer, or direct from Messrs. Kodak Ltd., Kingsway.

A holiday guide that will make a considerable appeal to our readers has been issued by our sister journal *The Motor Cycle*, and is given away as a free supplement with the last issue (July 1st). This holiday guide, although primarily intended for the motor-cyclist, is full of useful information regarding different parts of the country usually toured, and is complete with maps and illustrations of beauty-spots. Not only does the book deal with the British Isles, but also refers to Continental touring, and a very informative article, entitled "The A B C of Camping," will appeal to many holiday-makers. *The Motor Cycle* containing this useful 32-page booklet is obtainable from any news-agent, or from our publishers, Messrs. Iliffe & Sons Ltd.

A very complete film library service is offered by Messrs. Robinsons of Manchester House, Lowestoft. Readers of *The Amateur Photographer and Cinematographer* who are interested should write for particulars. Messrs. Robinsons' business has been built up by the generous interpretation of unlimited service, a policy that is also adhered to in the "still" side of the business, which was only started at

Easter. The service, in addition to the film library, offers a large variety of ciné apparatus, covering everything from a Pathéscope "Ace" projector to the complete equipment, including stage and theatre curtains, lighting, etc., of both public and private sub-standard theatres.

A book for the amateur film-maker, entitled "How to Write a Movie," by Arthur L. Gale, has just been published by Sir Isaac Pitman & Sons, Ltd. Mr. Gale is a well-known Hollywood scenarist, and has written his book expressly for the amateur movie-maker. Particular attention is paid to amateur problems, and useful suggestions are made for editing and titling, sound synchronisation and music effects. Several specimen pages from actual scenarios are included, as well as a complete "short." The book is a storehouse of helpful information, and is published by Sir Isaac Pitman & Sons, Ltd., Parker Street, Kingsway, W.C.2, price 7s. 6d. net from a bookseller, or 7s. 11d. by post direct from the above offices.

In a recent advertisement of David Allan, Whitfield Works, Mansfield Street, Kingsland Road, E.2, it was not stated that the firm's prices were subject to an advance of 10 per cent. We have been asked to draw readers' attention to this omission.

We note that four British airmen, who were making an air tour of Europe, were detained at Frankfurt while films in their cameras were developed and inspected. They were sentenced to fines totalling £80 for having in their possession four cameras, which in the opinion of the court they might have used to take photographs over German territory, as the cameras were not sealed on their departure from Vienna. It was not contended that any such photographs had actually been taken.

The latest winner of the Wallace Heaton Competition is Mr. Roger C. Carter, Oakwood, Broadway, Letchworth, to whom the weekly award of 21s. has been made for his print "Stormy Evening (Poole Harbour)."

At a recent meeting held at the Royal Society of Arts a scheme for the establishment of a Commercial Art Centre was set in motion. Briefly, the new Centre, which is being organised by a strong committee of workers prominent in the field of commercial art, sets out to establish in the centre of London, probably in Portland Place, a Commercial Art Centre at which will be displayed examples of the work of the greatest possible number of practising commercial artists, both photographic and otherwise, and will provide an ever-changing exhibition of commercial art. Those who are interested in this work, or who produce commercial work by photographic or other means, should communicate with the Hon. Organising Secretary, The Commercial Art Centre, 4, Bedford Square, W.C.1.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

82. Makers' Formulæ: Zeiss Ikon Negative Developers

Rapid Developer for Dish Use.

Metol	35 grs.	(4 grm.)
Hydroquinone	42 grs.	(4.8 grm.)
Sodium sulphite (anhydrous)	280 grs.	(32 grm.)
Potassium carbonate (anhydrous)	220 grs.	(25 grm.)
Potassium bromide	14 grs.	(1.6 grm.)
Water to	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take 560 grs. (64 grm.). If crystallised carbonate is used, take 280 grs. (32 grm.).

Dilute with an equal volume of water, and develop for 4 to 5 minutes at 65 degrees Fahr.

Tank Developer.

Metol	9 grs.	(1 grm.)
Hydroquinone	18 grs.	(2 grm.)
Sodium sulphite (anhydrous)	88 grs.	(10 grm.)
Potassium carbonate (anhydrous)	55 grs.	(6.25 grm.)

Potassium bromide	9 grs.	(1 grm.)
Water up to	20 oz.	(1,000 c.c.)

If crystallised sulphite is preferred, take 175 grs. (20 grm.). If crystallised carbonate is used, take 70 grs. (8 grm.).

For use, dilute one part of above with two parts of water, and develop for about 40 minutes at 65 degrees Fahr.

Fine-Grain Developer. (Buffered Borax.)

Metol	18 grs.	(2 grm.)
Hydroquinone	44 grs.	(5 grm.)
Sodium sulphite (anhydrous)	880 grs.	(100 grm.)
Borax	18 grs.	(2 grm.)
Boric acid	123 grs.	(14 grm.)
Water to make	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take double above quantity.

This developer is used without dilution, and is particularly suitable for miniature films. 20 oz. will develop 3 to 4 Contax films. Development time, about 20 minutes at 65 degrees Fahr.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Indoor Portraiture.

I am intending to take up indoor portraiture, and thought of getting a quarter-plate reflex with f/4.5 lens for general work, and using the same camera, but with a longer focus lens, for portraits. Would a convertible lens, which can be obtained fairly cheaply, be suitable? C. D. (London.)

A reflex camera can be used quite effectively for indoor portraiture, and, with modern sensitive material, an f/4.5 lens is sufficiently rapid. It is, of course, possible to use a convertible lens, but, although the single components may have a considerably longer focus than the complete lens, the working aperture will be considerably reduced. On the whole, we think you would do better to look out for a second-hand lens of sufficiently long focus that will cover a quarter-plate and yet be quite inexpensive. Some of the old portrait lenses would be quite satisfactory for this kind of work.

Adapting for "Sixteen-on."

I have a $4\frac{1}{2} \times 2\frac{1}{2}$ roll-film camera, and would like to adapt it for making sixteen exposures per spool instead of eight. I understand that two red windows will now be needed instead of one, and that a mask will be wanted, but what do I do about the view-finder? N.W. (Manchester.)

When you have fitted your mask into the back of the camera, rig up a temporary focussing screen so that you can see just how much the new size of picture includes. The view-finder will include more all round; this excess must be blotted out by carefully painting the glass of the view-finder with opaque black paint until the view it shows is reduced to correspond with that on the screen.

Reflections.

Can you explain the semi-circular markings on the enclosed negatives? The photographs, as you will see, were taken against the light, but a lens-hood was used. J. F. B. (Hornchurch.)

Without examining the camera it is not possible to say quite definitely what is the cause of the markings on

your negatives, but the most likely one is reflection of bright light from some part of the lens mount, which may have become bright instead of being dead black. If your lens-hood is rubbed bright on the front edge the effect would be much the same, as it might reflect quite a good deal of light into the lens.

Loading by Touch.

I recently loaded some plates, feeling lightly for the emulsion side and putting this face upward in the slide, but I am sorry to say that the prints have been returned with the scene facing the wrong way. How can I avoid this annoying mistake in future? G. H. S. (London.)

In loading plates in the dark it is only necessary to remember that they are packed film to film. The first plate is therefore film downwards, the second film upwards, and so on. If you are in doubt at any time, it is not much use feeling the surface, but, if you slightly moisten your lips and put a corner of the plate between them, one lip will stick, and this shows the emulsion side.

Soft Focus.

Can you tell me whether setting the lens slightly away from the position of sharp focus, or separating the components, will give the same effect as using a special "soft focus" lens? H. J. S. (Newton Abbot.)

Simply throwing a picture out of focus does not give the same effect as that resulting from the use of a lens specially made for soft focus, if only because with an ordinary lens incorrectly focussed objects at some distance or another are sure to be sharp, whereas with a true soft-focus lens no part of the picture is critically defined. In addition, a soft-focus lens generally gives a slight halo round the lights, which an incorrectly focussed lens does not do in quite the same way. The effect of separating the lens components may only be equivalent to re-focussing; it depends on the design of the lens.

Development Time.

Can you tell me how long to develop I.S.S. film in the Kodak roll-film tank, using the Kodak tank powder? The enclosed negative was developed for 25 minutes at 65° Fahr., but as you see it is rather flat. G. S. (London.)

The negative you send is certainly rather under-developed, but would give a satisfactory print on vigorous bromide or gaslight paper. If this is the result of development lasting 25 minutes, we suggest that you develop your next roll for not less than 35 minutes at the same temperature, but, as we do not know the exact kind of negative that you like, our recommendations cannot be more explicit than this.

Watch the Bellows.

I have a double-extension postcard size plate camera, which sometimes gives me pictures like the enclosed, which shows a wide blank margin all round. Can you explain this fault, which occurs only on some of my negatives? G. B. C. (Warwick.)

We should say that the almost certain cause of it is that the bellows are not pulled sufficiently forward away from the film, so that the back folds intercept some of the light. In many double-extension cameras the half-way fold of the bellows has a loop attached to it, and this is left hooked on to the lens-front except when it is desired to use the double extension. By this means the full opening of the back rather than the front folds is assured. If you fit loops or hooks to your bellows in this way we do not think you will have any further trouble with unexposed margins.

Enlarging with Camera Lens.

Could you tell me if it is detrimental to a high-grade lens to use it both for enlarging and for taking pictures? I ask because on enquiring for an enlarger with which I could use the lens from my camera I was very strongly advised not to subject the lens to such treatment. C. W. L. (London.)

We do not understand the reason for the advice given you. Plenty of high-grade lenses are used for enlarging purposes. In the case of what are perhaps the two best-known miniature cameras on the market, both makers sell and recommend enlargers specifically designed for use with the lens from the camera, so you need have no fear that the lens would suffer any damage through the dual use.

Keeping Solutions.

Can a standard M.Q. developer be stored in sealed bottles for about two months? And is a solution of hypo containing metabisulphite suitable for fixing negatives as well as prints? J. S. A. (Esher.)

We have found the standard metol-hydroquinone developer to keep quite satisfactorily for two months, provided that the bottle in which it was stored was not only tightly corked but full right up to the neck, and that the developer was, in the first place, made up with water which had been boiled for some five minutes to expel dissolved air.

The ordinary acid fixing bath of hypo and potassium metabisulphite is perfectly satisfactory for fixing negatives, but should contain rather more hypo (about 5 oz. to the pint) than is used for fixing prints.

COLOUR

Baker's were one of the pioneers in Colour Photography, and have always specialised in this development. A full stock of materials for all the colour systems is always available and includes Agfa Kodachrome, Dufay, and Finlay (for which we are sole London agents). Write or consult us.

CINÉ

We have a good selection of new and second-hand Ciné Cameras of all types, all in perfect condition and at lowest prices.

C. BAKER

244, HIGH HOLBORN, W.C.1

SUCCESSFUL PHOTOGRAPHY

demands the correct exposure of the negative. To estimate exposures in these days of super-sensitive films, and of extra large aperture lenses, requires a life-time's experience—far better to use a Drem Exposure Meter. Drem Meters are a revelation to students of Photography, and altogether there are now over 500,000 in use throughout the world. The Drem illustrated here is the

Electrodrem

The Perfect Exposure Meter
 FOR USE WITH ANY CAMERA.

The needle shows the lens aperture to be used for instantaneous exposures of 1/25th, 1/50th or 1/100th sec., without reference to tables, or making any calculations.

Range of daylight exposures 8 minutes to 1/1,000th of a second.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

SHEFFIELD — One minute walk from Town Hall

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **ILIFFE & SONS LTD.,** and crossed

Notes being untraceable if lost in transit should not be sent as remittances.

& Co.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

R. G. LEWIS

(CINÉ)

202, HIGH HOLBORN, LONDON, W.C.1

Specialisation in cinematography by enthusiasts like ourselves ultimately reflects beneficially on all keen cinematographers. At no time in the past fifteen years, since the first Pathé hand-turn camera was introduced, has such an efficient service been offered or deeper interest shown than at the present time, by R. G. Lewis (Ciné.)

The following is a selection from our large stock. Each instrument is subjected to a test and carries with it a guarantee of its mechanical and optical perfection.

CAMERAS:

- 16-mm. Victor Model V, turret head, speeds 8 to 64, visual focussing, hand crank with back winding, fitted with 1-in. f/1.5 Dallmeyer Speed, 15-mm. wide-angle triple anastigmat f/2.9, 3-in. f/4 Telephoto, Mortimer leather carrying-case. This outfit is in superb condition, not having been used more than half a dozen times. Cost £62.....£44 10 0
- 16-mm. Zeiss Movikon, with f/1.4 Sonnar and coupled range-finder, speeds 8 to 64, self-taking device, variable shutter from 20 degrees to 180 degrees, hand crank, leather carrying-case. Indistinguishable from new. Cost £101.....£72 10 0
- Cine-Kodak Model BB, American model, with 2 speeds, f/1.9 Kodak anastigmat, interchangeable, complete in combination case. Cost £30.....£17 15 0
- 16-mm. Zeiss Kinamo, cassette loading, f/2.7 Zeiss Tessar, very compact. Cost £20.....£9 9 0
- 16-mm. Siemens Model B, cassette loading, f/2.8 Bausch, speeds 8 to 64, coupled to iris. Cost £29 10s.....£18 0 0

LENSES:

- 3-in. f/1.9 Dallmeyer, adapted for Cine-Kodak Model K.....£9 15 0
- 2-in. f/1.9 Dallmeyer Super-Six to fit Filmo, Victor, etc.....£6 10 0
- 3-in. f/4.5 Kodak Telephoto for BB camera £6 5 0
- 1½-in. f/4 Dallmeyer Telephoto for Keystone 8-mm. camera.....£3 3 0

AMAZING VALUE !!

Constructed of Metal—NOT Bakelite.

Everybody, including the Press critics who have seen and tested the new all-metal Vauxhall Minicam, are amazed at the value. This low price is only possible because of the fact that we, as sole distributors, import large numbers direct from the factory in Germany, and, in addition, we are content to sell at a small profit. If you purchase a Vauxhall Minicam you will be saving approximately 50 per cent against the price of its nearest competitor.

PRICES:

2 1/2 square or V.P., f/2.9 anastigmat, Compur shutter..... **£6:19:6**
(Or under our SELF-FINANCED Hire-Purchase Terms of 12 monthly payments of 12/3.)

Ditto, with Prontor II shutter.. **£5:19:6**
(Or under our SELF-FINANCED Hire-Purchase Terms of 12 monthly payments of 10/6.)

Takes 12 pictures 2 1/2 sq. OR 16 pictures 2 1/4 × 1 1/4 inches.

A PLEASANT SURPRISE !!

Your old camera is worth MORE than you think. Fill in the coupon below and PROVE IT. We guarantee the highest allowance in the trade.

POST THIS TO-DAY

WALL'S DICTIONARY of PHOTOGRAPHY

and Reference Book for the Amateur and Professional Photographer

Fourteenth Edition—Revised

Edited and largely re-written by
F. J. MORTIMER, Hon. F.R.P.S.

A complete reference work for the practical photographic worker. It provides useful information in dictionary form on every phase of photography—technical, pictorial, scientific and general, and is in itself an explanatory index to all terms, formulæ, etc. All the latest photographic principles are incorporated in the present edition, which includes up-to-date information on all recent developments.

IKONTA

**f/3.8 TESSAR
COMPUR 1/400
ALBADA FINDER**

We have just purchased from Messrs. Zeiss Ikon a quantity of these cameras absolutely brand new, unused, and guaranteed by them, at a special price owing to introduction of camera body release, and no more will be available when our stock has been sold.

... A very fine popular size camera for any sports subject where a fast lens and high-speed shutter are required. ... Takes 8 pictures $3\frac{1}{4} \times 2\frac{1}{4}$ in., or 16 pictures $2\frac{1}{4} \times 1\frac{3}{4}$ in., and is safe for panchromatic film. ... F/3.8 Zeiss Tessar lens, Rapid Compur 1 sec. to 1/400th sec., with delayed-action (take yourself) release.

This delays shutter for about 12 seconds when desired. The Albada finder is particularly valuable when exposing at rapidly-moving objects. The exact amount of the subject being photographed is seen limited by a white rectangle which appears to be as far away as the objects being photographed. The field of view is large and clear and the image erect and unreversed. ... 100 per cent self-erecting, always ready for the quick snapshot. A press on the opening button and the camera front is rigidly in the ready position. ... Two-point setting of iris and focussing scale, hinged back, rotating lens focussing. Size $1\frac{1}{8} \times 3\frac{1}{8} \times 6\frac{1}{2}$ in.

APPROVAL

Money refunded in full if not approved, and returned within five days of receipt. Sent C.O.D. if desired.

Brown leather sling case, 7/6 extra; Proxar lens, 20/- extra; Yellow filter, 12/- extra.

HIRE PURCHASE TERMS

18/10 with order and eleven monthly payments of 18/4 each, extension of terms if required. Let us send you the necessary form and make an offer for your own camera.

LEICA PHOTOGRAPH BY
T.B. REDMAYNE, BOURNVILLE

PHOTOGRAPHS EVERYWHERE - OF EVERYTHING

WITH THE *Leica* CAMERA

This interesting Leica photograph was taken on the Gold Coast and shows the natives loading cocoa by surf boats. The Leica camera is made to withstand the rigours of the tropics or the arctic, and whether you photograph abroad or at home it is equal to every occasion.

Ask any good class photographic dealer for a demonstration or write for literature to

E. LEITZ (LONDON), 20, MORTIMER STREET, LONDON .W.1

You can bring back the colour, too

'Kodachrome' will bring it **all** back for you—the full colours of the foliage, the yellow light on the tree trunks, the blue sheen on the water. And—as reproduced in these "Kodachrome" transparencies—it is beautiful, **grainless** colour! What is more, you do not need to be a plutocrat to achieve this photographic miracle: the **ideal** 35 mm. precision camera for taking these colour transparencies is the low-priced Kodak "Retina"—simple to use, yet having a lens and shutter loaded with power. "Kodachrome" is available in 18-exposure, daylight-loading cassettes to fit all 35 mm. cameras, price 12/6, including processing by Kodak Limited in England.

The "Retina"

Choice of $f/3.5$ lenses,
"Compur" or "Compur-
Rapid" Shutters,
£10 . 10 0 — £15 . 0 . 0

THE "LITTLE RASCAL" MIGHT WIN YOU £25

—IN THE LATEST WALLACE HEATON "BABIES" PHOTOGRAPHIC COMPETITION

You can take a picture of any baby from a few weeks to three years old. Snap the little toddlers on the beach, on the lawn, or in the pram. Get them laughing, crying or looking coy. We do not recommend them taken asleep—that misses the eyes, which means so much in a baby picture. Anyway—it's up to you to do your best. There's a good cash prize for the best photography. You have until July 27th in which to send in your entries for this subject.

THE RULES ARE SIMPLE :

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final.

AMATEURS ONLY (Full name, address, title of entry and coupon on back of each entry).

ANY MAKE OF CAMERA or MATERIALS.

DEVELOPED, PRINTED OR ENLARGED ANYWHERE.

ANY SIZE MOUNTED OR UNMOUNTED (not less than 8x6 unmounted is recommended).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.)

Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.

Prizes are 21/- each week and 8 Certificates of Merit. £25 (Twenty five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made and no entries will be returned unless above is complied with.

Acceptance of these rules, etc., is a condition of entry.

Address Entries to "Babies" Competition,

New Agfa 'KARAT'
12 pictures 24 x 36 mm.
(LEICA size) for 1/5

Special f/6.3 anastigmat of very fine quality. Shutter gives speeds of 1/25th, 1/50th, 1/100th and B., carefully designed for simplicity and maximum results. Automatic film wind renders double exposures impossible; easy loading with self-threading. Most efficient and accurate **ONLY** optical finder. **£5:5:0**
12 monthly payments of 9/2.

MAGAZINE CINÉ-KODAK

Chargers loaded with 50-ft. 16-mm. films inserted in 3 seconds. Film instantly interchangeable, e.g., Kodachrome to black-and-white and vice-versa, without any loss of footage. F/1.9 Kodak anastigmat, also option of four telephotos 2 to 6 in., universal finder. Ask for full description, or call and see. Complete in leather case **£40**
12 monthly payments of 70/-, 24 of 35/-.

VOIGTLANDER "BESSA"

Built-in Range-finder.

Takes 8 pictures 3½ x 2½ or 16 2½ x 1½ on standard 3½ x 2½ film.

Unique trigger release under baseboard. Yellow filter permanently attached in folding mount. Quick self-erecting front, depth-of-focus scale. F/3.5 Helomar anastigmat in delayed-action Compur shutter **£16:10:0** to 1/100th sec.
12 monthly payments of 28/11, 24 of 14/6.
F/3.5 Skopar anastigmat, shutter as above. **£18:15:0**
12 monthly payments of 32/10, 24 of 16/5.
F/3.5 Heliar anastigmat, shutter as above. **£21:0:0**
12 monthly payments of 36/9, 24 of 18/5.

Noted LEICA Stockists

Model IIIa, shutter speeds 1 to 1/1,000th sec., T. and B., f/2 Summar, with side release (all chromium) **£43:0:0**
12 monthly payments of 75/3, 24 of 37/8.
As above, but with f/1.5 Xenon and quick-wind device (as shown) **£63:0:6**
12 monthly payments of 110/4, 24 of 55/2.
5-cm. Xenon Anastigmat only, coupled for Leica. **£34:0:0**
12 monthly payments of 59/6, 24 of 29/9.
Quick-wind Device. **£3 14 6**

REFLEX-KORELLE

Takes 12 pictures 6 x 6 cm. on normal 2½ x 3½ roll film.

Interchangeable lens mount. Quick film-wind coupled to shutter, entirely preventing double exposures. Self-capping focal-plane shutter, 1/25th to 1/500th sec., T. and B., **£17:17:0** f/3.5 Tessar.
12 monthly payments of 31/3, 24 of 15/8.
Model II, shutter speeds 2 to 1/500th sec., T. and B., f/3.5 Radionar **£16:16:0** anastigmat.
12 monthly payments of 29/5, 24 of 14/8.
F/3.5 Zeiss Tessar. **£22:10:0**
12 monthly payments of 39/5, 24 of 19/9.

ZEISS IKON 8-mm. Movikon Ciné Camera

For both single 8-mm. and "double-8." With f/2 Sonnar. Three speeds, 8, 16 and 64 frames per sec. Finder usable at right-angles. Delayed-action release. Fine production with many notable features

£48:17:6

12 monthly payments of 85/6, 24 of 42/9.

TEMPHOT Exposure Meter
New and improved, sensitivity increased four times, but fully retains original lightness and compactness. Covers all conditions from bright outdoor to dimmest interiors. Including purse. **£4:5:0**

New Zeiss Ikon NETTAR SERIES 510

A Zeiss Ikon product at a more than popular price. For 16 pictures on standard 3½ x 2½ film. Quick, self-erecting front. "Two-point" setting for easy focussing, brilliant and direct-vision finders. Shutter release on camera body (on 1/4.5 models).

F 6.3 Nettar, Dervall 3-speed shutter **£3:7:6**
Ditto, Telma delayed-action shutter **£4:0:0**
F/4.5 Nettar, Kilo shutter, 1 to 1/175th sec. (side release) **£5:12:6**
12 monthly payments of 9/10.

ENSIGN SELFIX

Takes 16 pictures 2½ x 1½ or 8 full 3½ x 2½ on standard spool. Quicker self-erecting mechanism, easier loading and focussing, very efficient optical finders, f/7.7 Ensar, speeded shutter, 1/25th, 1/50th, 1/100th, **£2:5:0** T. and B.
F/6.3 Ensar, ditto. **£2:15:0**
F/4.5 Ensar, ditto. **£3:15:0**
12 monthly payments of 5/9.
F/4.5 Ensar, Prontor I shutter, 1 to 1/130th sec., T. and B. **£5:15:0**
12 monthly payments of 10/1, 24 of 5/1.

Have you tried GEVAERT ANTI-HALO REVERSAL FILM

8 mm.—9.5 mm.—16 mm.

All Gevaert Film is sold at separate prices for film and processing. Leaflet on request, with home processing instructions.

GEVAERT LTD.

Gevaert Photographic Materials are obtainable from good photographic dealers everywhere.

GEVAERT LTD., WALMER RD., W.10

This film completely eliminates halation even under the most adverse circumstances, due to a special black coating between the emulsion and the base. This prevents not only the usual halation troubles, but also the results of light being reflected back from the base on to the emulsion. The black coating disappears during reversal.

Available in three varieties:

Ortho Reversal, Panchro Normal, Panchro Super.

Ortho Reversal and Panchro Normal are suitable for all normal work. Panchro Super possesses extreme speed and is ideal for indoor work.

A FREE book - for every photographer, amateur and professional!

TENNIS PLAYERS

.... DO YOU REALISE THAT

The cost of 4 tennis balls a week

WILL BUY A

Leica

CAMERA—IF YOU BUY IT FROM US

Play much tennis? Doesn't take long to knock the cover off half a dozen balls, does it? And that's 6s. 6d. gone west for good and all. Now for much less than that—4s. 1d. a week to be precise, you can own a Leica, and get thrills not only all the year round but for the rest of your life. Take it along to the club and get action shots of the singles champion with the demon service. Or, as *anno Domini* creeps on and you find that five sets straight off are a bit too much for you, what a joy it will be to wander quietly through the countryside bringing back the scenes in your Leica. Or staying in the garden and getting lovely shots of the children without their knowing it. Then there's indoor photography—but there, we could go on talking for hours about the joys of using a Leica—we know because we use it ourselves. The best thing is to decide which model you want—and come along for a demonstration or write us. We will help you all we can both in the matter of easy payments and exchange allowances.

★ **4/1d. A WEEK BUYS

LOOK AHEAD . . .

She'll enjoy seeing this movie at her 21st birthday party!

That's the reason why you should be making your films now with a Paillard ciné camera.

You'll be glad in after years that you did your filming with a first-class instrument—it will be too late then to go back and re-film faces and places which have changed.

Apart from this, the Paillard ciné camera gives you more scope and fun from filming now.

If a subject is at all filmable the Paillard will take it, because it has the biggest range of refinements ever before available in one sub-standard instrument, including:—

- Critical visual focussing covering a large part of the subject.
- Variable speeds, 8 to 64 and all intermediate.
- Semi-circular turret head for three lenses. In spite of its compactness, the turret head has wide-spaced lenses so that the field of wide-angle lenses (F 15 mm.) is not interfered with by telephoto lenses.
- Special tri-focal view-finder giving parallax correction down to 2 ft.
- Counter of high precision, with audible footage indicator.
- Range of instantaneous exposures from 1/10th to 1/500th sec. "Time" and "picture-per-picture" device.
- Possibility of filming backwards whole length of 100-ft. Film is taken up and counter subtracts exact amount (indispensable for superimpositions, lap dissolves, etc.)

See the difference with a PAILLARD CINE CAMERA

MADE BY THE MAKERS OF PAILLARD-BOLEX PROJECTORS

WHY NOT MOVIES?

The cost is so little

THE CINÉ-KODAK 8 WAY

There are many amateur photographers who enjoy the thrills of movie-making. And why not? If you enjoy photography you'll enjoy making movies much more. It is natural that when a photographer takes up filming he produces first-class films. You are able, with your trained photographic eye, to pick out those scenes and incidents which will show up best on the screen. Unlike the inexperienced you can make every foot of film pull its full weight in entertainment value, and, incidentally, avoid all film waste.

If previously the cost has deterred you, you probably haven't realised that on Wallace Heaton's new easy payment plan

FOR 4d. A DAY YOU CAN OWN A CINÉ-KODAK 8

And film costs, the Ciné-Kodak 8 way, are divided by four. A 25-ft. roll costing 10/- gives you the same length of showing on the screen as 100 ft. of 16-mm. film. Why not, this year, exploit your skill as a photographer, and make first-class movies? A first monthly payment of 9/- and a Ciné-Kodak 8 is yours to take on holiday. We will take your present camera as part payment—our exchange allowances are the most generous in the trade.

WALLACE HEATON LTD

Wallace Heaton

The holder of this coupon is guaranteed by me to have the Ciné-Kodak 8 expertly demonstrated. If out of town post this with your name and address and I will gladly forward full descriptive literature.

YOU GET WHAT YOU SEE WITH THE

Rolleiflex

BECAUSE

FULL PARALLAX COMPENSATION IS PROVIDED FOR

Since their introduction both the Rolleiflex and Rolleicord have always had **parallax compensation**. Right from the earliest models the finder lens, the taking lens and the reflex mirror were built to work in conjunction with one another so that what you see on the focussing screen you get on the finished print. This, however, is only one of the numerous advantages of owning a Rolleiflex. Others are **economy**—12 exposures size $2\frac{1}{2} \times 2\frac{1}{2}$ on $3\frac{1}{2} \times 2\frac{1}{2}$ 8-exposure roll film for 1/- (1d. a shot). **Versatility**—accessories are available for plates and 35-mm. ciné film, so that when you possess a Rolleiflex you really possess three cameras in one. Other accessories make it still more versatile. **Guarantee**—Every Rolleiflex is sold with a printed guarantee of mechanical and optical perfection. With f/3.5 Zeiss Tessar lens and Compur Rapid shutter, speeded to 1/500th sec., T. and B., it costs only £25.

Your dealer will be glad to demonstrate. Or write for Rolleiflex/Rolleicord brochure and address of nearest stockist from the Sole Importers:—

If you insist on perfection this is the camera you want

THE Rangefinder Bessa has everything you can usefully employ in a folding roll-film camera. It is beautifully made throughout, and incorporates every conceivable device for better photography. The specification includes a coupled prismatic focussing device which makes "out-of-focus" negatives impossible, interchangeable light filter permanently hinged to the lens mount, trigger shutter release under the baseboard which enables you to keep the camera dead

steady, and a mask for half-size pictures. Other features of this remarkable camera are Compur Rapid delayed-action shutter (1 sec.-1/400th, B. and T.) and Voigtlander SKOPAR F/3.5 anastigmat lens. Price £18 15s. Other models also with Compur shutters at £16 10s. and £21. Ask your dealer for a demonstration, or send for the Rangefinder Bessa brochure to:

RANGEFINDER BESSA

● FOR SPEED AND FINE GRAIN USE ILLUSTRATION FILM

The Complete 9.5 mm. Cinematographer

By HAROLD B. ABBOTT

Because of advances in film technique this book supersedes the author's former successful book "Motion Pictures." The beginner can take it up and find everything he needs to know in order to make successful pictures.

How to choose a 9.5-mm. ciné camera; how to expose correctly; what to take and how to take it; full instructions on developing and printing; methods of planning, editing, titling and trick effects; the art of projection; methods of operation, screen and picture sizes; giving an efficient show; all these are explained in detail.

There are nearly 100 illustrations. The book, packed with useful information, is a comprehensive course of instruction in amateur cinematography.

A new book which will help you to get
the best results with your camera!

Brighter Photography

by DAVID CHARLES, F.R.P.S.

This handy book reveals in a clear, attractive way the secrets of successful photography. Though primarily intended for the novice, it is invaluable to every keen camera user.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. Details of the various photographic materials on the market are given, and there are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing.

In addition there are over one hundred and sixty illustrations, each numbered and each conveying a really useful hint. By simple cross references these illustrations provide a series of clear, concise lessons in the art of making better pictures.

Look!

Agfa Karat

**A NEW MINIATURE TAKING
12 PICTURES, 24×36 mm., ON 35-mm. FILM**

This new Agfa establishes a distinct record in value. We are confident that in its price class there is nothing to compare with its efficiency and performance.

It has an accurate shutter speeded 1/25th, 1/50th, 1/100th sec., T. and B., and an excellent Agfa Igestar f/6.3 anastigmat lens which guarantees needle-sharp definition and a good depth of focus.

A notable feature is the impossibility of double exposures and the fact that the shutter cannot be released accidentally (even though it is set) while the camera is in the closed position. The ready position is achieved by a bellows extension at the touch of a button.

Loading is definitely an advance on anything we have yet seen. You just drop the cassette into position, pull out sufficient film to engage the sprockets, snap the lock into position and that's that, a 10-second operation.

Built-in optical direct-vision view-finder; focussing from infinity to 3 ft. A really excellent job.

AND IT'S YOURS for 7/5 A MONTH or £5 5 0 cash.

"SHE'S A BEAUTY"

When our customers come in, a week or two after they have purchased their Rolleicord and we enquire how they are getting on with their camera, they reply, "She's a beauty, so simple to use, such wonderful results. I'm so glad you recommended me to have a Rolleicord."

The Rolleicord saves you the expense of enlargements because contact prints are large enough to show the fullest detail of your pictures. 12 pictures on 3½×2½ 8-exposure roll film for 1/-. The separate viewing lens and focussing screen eliminates useless snapping because you see your picture full size and right way up, therefore you can reject all subjects which do not appeal to you before you have wasted film on them. The high-class

Zeiss Triotar lens will not only give you perfect holiday pictures, but will give excellent results all the year round. The Compur shutter is speeded from 1 to 1/300th sec. also T. and B., and is set and released by one lever. The Rolleicord is so designed that it is easily manipulated. Takes all Rolleiflex accessories except only the angle mirror.

With Zeiss Triotar f/3.5 lens and Compur shutter, speeded to 1/300th sec., T. and B. £16 10 0

With Zeiss Triotar f/4.5 lens and Compur shutter, speeded to 1/300th sec., T. and B. £14 10 0

Vol. LXXXIV. No. 2540.

NEXT week's issue of *The Amateur Photographer* will be our special Summer Number. Not only will it be considerably enlarged so far as the number of pages is concerned, but a great variety of topical articles, illustrations, and useful information, especially for the amateur photographer on holiday will be included. Another feature that will be of considerable interest and value to innumerable readers will be a description of all the available cameras in the popular $2\frac{1}{4} \times 3\frac{1}{4}$ size. These will be reviewed and compared, and the vast army of photographers who use this size of film will find much of interest for them in the descriptions of the cameras. "The A.P." Summer Number, with its "all-over" cover in full colour, will be on sale on Wednesday next, July 21st, and we would suggest to our readers that they order their copies well in advance.

"The A.P." Prize Prints.

An annual exhibition that always attracts a great deal of attention from our readers is that devoted to a display of the pictures awarded prizes in "The A.P." competitions during each year. This exhibition, which is a regular feature of the House Exhibitions of the Royal Photographic Society, 35, Russell Square, W.C.1, has again been arranged and is now open to the public. It includes the prize pictures from the Advanced Workers' and Intermediate Competitions since June, 1936, and a selection of those awarded Honourable Mention. The special award for the best picture in the twelve months has been made to Mr. A. H. Roche, 53, Loveday Road, Ealing, W.13, for his picture entitled "Age." This is a fine

TOPICS of the Week

THE TOP OF THE HILL.

A good example of "delayed-action" photography in which the photographer includes himself in the picture. An article on this subject appears elsewhere in this issue.

character study of the head of an old woman, and of very considerable technical merit. A reproduction will appear in our pages at an early date. In the meantime our readers should note that "The A.P." Prize Print Exhibition is open at the above address until the end of the month, and admission is free.

"The A.P." Index.

The index for the half-yearly volume of "The A.P." is now ready, and contains complete references to articles, illustrations, etc., that have appeared in our pages from January 6th last until June 30th. As on previous occasions, it will be realised after an inspection of this index how extensive has been the amount of information included in six months' issues of "The A.P." Each half-yearly volume is, in fact, a mine of information on all photographic matters both pictorial and technical, and a picture gallery in miniature. The index can be obtained from our publishers, Iliffe & Sons, for 3d., or 4d. post free, and with binding case for the half-yearly volume, 4s. 1d. post free.

Poison and Antidote.

It is quite a long time since the Press recorded a case of photographic poisoning. Poisoning by photographic materials was at one time a favourite topic. One had a vision of a queue of photographers waiting to commit suicide by consuming cyanide of potassium. It almost seemed as if photography ought to be scheduled a dangerous trade. Cyanide of potassium has not lost its lethal qualities, but an antidote has been found from the same working bench. This is methylene blue. In one scientific journal we find recorded several cases of cyanide

poisoning which have been saved by the use of this dye. In one case the victim was so far gone that respiration had stopped and heart sounds were barely audible, and the man was cyanosed and cold. A solution of 1 per cent of methylene blue was mixed and injected, and before the injection was completed the man began breathing, regained consciousness, and opened his eyes, and within a few hours he was normal. Every poison has its antidote, but not always so near at hand. Fortunately, cyanide of potassium is of very infrequent use among amateur photographers.

Panorama.

An exhibit in a shop window in Holborn is just now attracting considerable attention. It is a panoramic reproduction of four negatives taken with a miniature camera. It measures nearly 4 ft. by 1 ft., and it is a view of London so comprehensive as can hardly have been brought before within a frame. On the extreme left is a view of the

Central Criminal Court, and on the extreme right the County Hall, and in between are St. Paul's, the great stretch of river with three bridges, and the buildings of South London. The four little negatives from which it is reproduced are also mounted. The work is not only remarkable for the range of view, but also for its technical excellence, its clear detail, and its interesting sky. The point from which it was taken must have been somewhere about the Shell-Mex building just above the Embankment.

Putting in Figures.

The new series of Underground posters showing famous places around London all have figures in them; even the churchyard has its mourners. The artist, of course, can take liberties with his figures to a greater extent than the photographer; he can make them mere wraiths or suggestions of figures if he chooses, and he can diminish or enlarge them in keeping with the subject. The photographer is more

or less bound by the fact that most people are between five feet and six feet in height and have two arms and two legs. But we do think that photographers are not always as alive as they might be to the use of figures in pictorial compositions. Even in commercial work innumerable photographs are produced of buildings and estates which would be greatly enhanced in interest and commercial value by the introduction of figures, but as a rule the room or garden remains untenanted. Recently for a certain purpose a photographer was instructed to obtain a series of photographs of a boarding school. The large prints when delivered proved to be technically excellent, but although the boarding school was in full working order there were no boarders. The dining-room had the tables all laid out for the meal but there was no one to partake. The dormitory was a succession of empty beds. The result was to convey the sense of a museum piece rather than a living institution.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

The Petzval Lens.

I shall be greatly obliged if you can supply me with full particulars about the Petzval lens. I have read that it is the best for enlarging. Do you confirm this? If so, is it still obtainable?
F. B. A. (Carlisle.)

We shall have to go back to rather ancient history, photographically, for it was in 1840 that Voigtlander first made lenses from a formula worked out by Joseph Petzval, a Viennese mathematician. The invention was an important one, as portraiture by the Daguerreotype process was almost impossible, owing to the serious lack of rapidity in the single lenses then used, and to the low sensitivity of the Daguerreotype plate.

The Petzval lens as first made had a full aperture of $f/6$, and an improvement by Andrew Ross increased this to $f/4$. The construction of the original lens is shown in the upper diagram, where it will be seen that it has four elements. (The arrow

indicates the direction of the light.) The front component consists of a positive lens of crown glass cemented to a negative of flint glass. At the back are a negative lens of flint, and a positive of crown, with an air space between. It is obviously unsymmetrical.

It was chromatically corrected, free from distortion, and on account of its freedom from spherical aberration and coma the definition in the centre of the field was excellent although it fell off considerably towards the edges of the circle of illumination. In fact, the field covered sharply was comparatively small, and suffered from pronounced curvature. As a lens for portrait work, for which it was intended, it was an enormous advance on anything previously made; but it fell short for architecture, landscape, and all work requiring good definition over the whole field.

J. H. Dallmeyer, in 1866, obtained better correction for spherical aberration, by making the modification shown in the second diagram. The front combination was left unaltered, but the positive and negative elements at the back were not only modified but their position was reversed. Voigtlander replaced the back lenses by a cemented combination; Sommer made a modification which allowed of an aperture of $f/2.3$.

In view of these and other changes, it became more correct to speak of lenses of a certain construction as being of the Petzval type. The original lens was fundamentally the ancestor of many thousands of others, and lenses of more or less similar type are still made and used for portraiture and other purposes.

The statement that a Petzval type lens is the best for enlarging purposes was true only until it began to be superseded by a still better type—the anastigmat. This, in its many forms, has great advantages over any other type of lens for almost all photographic purposes—including enlarging. It is only necessary to consider, for example, its flatness of field, and the uniformity of definition even at very large apertures.

ORTHO or PAN?

This article deals with a subject of interest to all amateur photographers, especially beginners. It explains the use of colour-sensitive materials, and gives some hints upon the subject of filter factors.

WITH regard to the choice of sensitive material many photographers are exercised in their minds as to whether orthochromatic or panchromatic films or plates are best suited to their needs. In these days all plates and films supplied for amateur work possess some degree of colour sensitiveness. They differ in degree, and range from orthochromatic films which are slightly sensitive to yellow and green to others of the 'chrome type. These, while highly sensitive to yellow and green, are more or less "blind" to red, which will be rendered as black in the final photograph.

The range of panchromatic material is sensitive to the whole of the visible spectrum, and in addition there is the type known as "super sensitive," or "hypersensitive." The latter are given additional sensitivity to the red primarily with a view to providing increased speed when photographing subjects illuminated by artificial lighting that includes a large proportion of red rays.

Speed.

In the past colour sensitiveness was employed in order to ensure that coloured objects were rendered according to their intensity. Yellows and greens, for example, on non-colour-sensitive material appeared as dark grey or black.

The modern photographer has another use for colour sensitivity, because the "speed" of the material to the various light sources is closely connected with it. Nor is this confined to illumination of artificial character. Early in the morning, or late in the day, the light often presents distinct coloration, yellow or red. In this light a non-colour-sensitive material requires a much longer exposure than the scene's apparent brightness, as judged by eye or photo-cell meter, would lead one to expect. Less increase is required by an "ortho" film, while a normal "pan" film requires no extra exposure. The high sensitivity to red of the "super-speed pan" film means that at sunset or early morning, or by artificial light, it requires even less exposure than inspection of the scene would suggest, so that it seems much faster by that light than it does in daylight.

While the manufacturer makes plates or films sensitive to the whole of the spectrum, there is always greater sensitiveness to the blue-violet than to the other rays. To retard this satisfactorily a colour filter is required.

Control of Tonal Values.

The use of a colour filter provides the photographer with some measure of control over the tonal values of the subject when using orthochromatic films or plates. The blues are retarded and will be deeper in tone, and the yellows and greens lighter, when a suitable colour filter is employed, but this has little effect upon the red, because the emulsion is not sensitive to red and a filter will not make it so.

The use of panchromatic material, however, gives the photographer complete control over all the tonal values of the subject, so much so that any one colour may be exaggerated at the expense of others. It is possible, for instance, by the use of a blue filter to produce a result equivalent to an "ordinary" (i.e., non-colour-sensitive) plate, and with a blue-green the colour translation will be similar to that secured with an unscreened ortho.

Correct colour values are easily secured on panchromatic material with suitable screens, while by the use of a red filter stronger contrasts may be introduced than the original subject displays. For example, a light blue sky with light fleecy clouds may be made to appear as if black. Haze can be eliminated by a deep yellow filter.

For subjects where partial colour control is desired even unscreened "pan" material does well, and the result approximates to that secured on orthochromatic material with a "medium" screen, but without the increase in exposure that the latter necessitates.

Filter Factors.

It is important that the photographer should fully understand the effect of the filter in use upon exposure. No filter can have a definite factor respecting the necessary increase in exposure. The factor varies with the different emulsions—for example, one maker indicates that the use of a given filter necessitates an exposure increase of ten times with ortho film and three times with a panchromatic, while for another

panchromatic the exposure is but twice the normal.

The exposure factor will also vary with the source of light. The safest course is for the photographer to use the filter made for the particular material in use and for which exposure factors are supplied by the maker.

In the use of filters not issued by the makers of sensitive material data are obtainable from the makers of the filter for materials of different sensitivity, and for various lighting conditions.

By the use of a filter issued by the makers of the material in use, the photographer is assured that he has the maximum efficiency, with the minimum of increase in exposure.

The following table gives the names of some of the best-known colour filters available for the amateur. The figures in the two columns refer to the number by which the normal exposure must be multiplied when each filter is in use.

"Delayed"

By F. N. BAKER.

"self-timer" for attachment to shutters that are not fitted with D.A.

Even if people are available for my pictures I often prefer to use myself. For two reasons: I know exactly where and how to place myself in the picture without the need for explaining my ideas and possibly having them misunderstood or misconceived. And, secondly, because I can be completely unselfconscious before my own camera (in spite of being

STUDYING THE MAP. This picture, which includes the photographer, would not have been possible without the delayed-action device. $1/50$ th sec., $f/8$, Verichrome.

MOST amateurs are familiar with the "delayed-action" adjustment on the shutters of their cameras, and have doubtless made use of it when taking groups in which the photographer himself wishes to be included.

When the shutter is set for D.A. and the release pressed, a definite period elapses, usually about 12 seconds, before the exposure occurs. The exposure can be set at any speed marked on the shutter from 1 sec. to the highest speed. The 12 seconds delay permits the photographer to get in any pre-arranged position in front of the camera and pose before the shutter goes off.

How often does it happen that on a lone excursion one comes across a delightful scene that needs only a little

"human interest" to make it perfect. And just as often no one turns up to provide this. With a delayed-action release the difficulty is easily overcome. One can supply one's own human interest and capture these pictures after all. For this reason alone the solitary worker ought never to be without this device, which incidentally can also be obtained as a separate

THE FRIENDLY GAME. Daylight and artificial light. $\frac{1}{2}$ sec., $f/6.3$, S.S. Pan.

extremely camera-conscious before other people's cameras. Perhaps it is because I can always destroy my own negatives if I dislike the results!).

With a little care even difficult and unusual subjects can be taken with delayed action. For example, a close-up of a person's hands at work as he would see them. In fact, such a photograph would be almost impossible without using delayed action and oneself as the subject. The devising of such photographs is extremely absorbing and the results of great interest.

The procedure with delayed-action subjects is very simple. The subject is just arranged carefully in the finder, allowing of course for the inclusion of oneself; the focussing and setting of shutter and D.A. device

HANDS AT WORK, AS I SAW THEM. A good example of the value of a delayed-action shutter. 1 sec. exposure, $f/6.3$, S.S. Pan.

Action"

attended to, and, lastly, the shutter is released. Promptly walking into the picture you assume the desired attitude until you hear the shutter fire. Do not under any circumstances be tempted to stare at the camera to see if it has fired. Rely upon the sound alone.

Once the period of delay is accurately known it is quite possible to take pictures containing some action. For instance, after setting the device with the shutter at a fairly high speed, one can move into the picture, counting the seconds to ensure that the shutter will fire when in the desired position.

Though delayed-action photography is a pleasant outdoor hobby in summer-

THE TEASER. A delayed-action snapshot.
(By courtesy of "The Daily Herald.")

an improvement in the technical quality of one's work. The use of the device demands a tripod, thus one is assured of freedom from camera shake in those photographs. Also if a tripod is carried for the sake of these pictures it is highly probable that it will be used for photographs where otherwise one might have to risk a slow instantaneous exposure in the hand or else give a shorter exposure than is desirable. A further point in favour of delayed-action snaps is that they permit of unhurried and careful working.

Incidentally, what real photographer would not rather have some really pictorial snaps of himself to adorn the pages of his album than awkwardly-posed groups?

A REST IN THE SHADE. A "record" photograph made interesting by the introduction of figure by delayed action.

time, even on dull days or in the evenings one can still indulge in this mild vice indoors with the aid of flashpowder instead of the usual self-timer.

The period of delay between lighting the touch-paper and the firing of the flash is amply sufficient to enable the photographer to be included in the picture. Provided the room is only dimly lit so long as the shutter is opened for the flash perfect results can be obtained every time.

One result of being prepared for delayed-action pictures is

THE BREAKFAST EGG. 1 sec. D.A. exposure, f/6.3, S.S. Pan.

Readers' Hints, Tips and Gadgets

EXTENDING THE REFLEX HOOD.

ADMIRABLE though the popular small square reflex is for practically all types of work, there is one little disadvantage about it now the sun has reached the zenith of its summer journey.

As the light becomes more vertical accurate focussing in the diminutive low hood is apt to be considerably interfered with by a shaft of light shining on the screen.

A useful gadget that costs practically *nil* and only a few odd moments to construct is a small cardboard hood about 5 in. high that can be slipped over the existing hood (which is about 2 in.) and so add about 3 in. to its height.

All that is required is a piece of good quality cardboard (not necessarily thick) about 8 in. by 5 in. This can just be seamed along the requisite places and then folded and the two loose ends joined with a strip of adhesive tape. A better method is to cut four equal strips 2 in. wide (or just a bit larger than the width of your own particular hood) and then join each piece with a strip of plaster. If this second type is carefully made it will be possible to fold it up when not in use, and it can then be carried in the pocket. The inside of the hood can with advantage be blacked, and according to your skill so can the outside be improved, either by blacking or by covering with thin leatherette or other material that will still permit it to be folded. This handy little gadget will prove of great practical use, and is one that ought to have long ago been on the market. (Manufacturers please note, and send royalties to the author!) F. READ.

A CONVENIENT CAMERA SUPPORT.

FOR long instantaneous or brief time exposures the photographer who does not carry a tripod usually relies on finding some support such as a convenient wall or window-sill on which he can prop up his camera. Away from towns supports of this kind are very rare, but the country provides supports of another kind in trees and the upright posts of fences.

By the aid of the home-made gadget illustrated here a camera can be strapped securely, and held firmly level, to any upright object small enough to allow a yard-long strap to pass round it.

The base of the support, of dimensions $5 \times 3\frac{1}{2}$ in., is cut from hard wood $\frac{3}{8}$ in. thick. Two pieces of $\frac{1}{2}$ -in. square wood (A, Fig. 1) are screwed to it $\frac{3}{8}$ in. from each end. At B the base is cut away to take a strap 2 in. wide, and a leather strap-holder is screwed to the fillet A. To the other fillet a webbing strap 2 in. wide and about 36 in. long is fixed by means of a metal plate and screws. An angle-plate drilled to take a tripod-screw is attached to the base as shown at A in Fig. 2.

At B in Fig. 2 is shown a strip of plywood 2 in. wide, and in length a fit between the fillets A of Fig. 1. To each end of this is fixed a piece of wood $\frac{1}{2} \times \frac{1}{2} \times 3\frac{1}{2}$ in., one of these pieces carrying a 4 B.A. screw as indicated in the drawing. A clearance hole for this bolt is drilled in the base, and the whole inner tray is held on the base by a nut or terminal head.

In use, the camera is screwed to the bracket by the usual tripod-screw, and the whole is strapped to the tree or post as indicated in the third sketch. As the edges of the inner tray clamp up against the tree, the support is firm and steady, and the camera has no tendency to tilt downwards by its own weight. If the tree or post is more than 10 in. in diameter, firmer support is obtained by removing the inner tray.

BENDING METAL TUBES.

IN case there are any more readers of "The A.P." besides your recent correspondent who had difficulty in bending metal tubes, the following will be found a reliable method.

First of all make sure that the tube is of a good quality seamless type, as seamed tubes are liable to burst at the seams in any case. The method I describe is in everyday use by the largest tube benders in this country, and is very simple. Stop up the end of the tube with sand about half an inch high. Then melt a sufficient quantity of resin in a small plumber's lead ladle and pour it in the tube until full. Allow the resin sufficient time to set. It will then be found that the tube can be bent as easily as a soft iron solid bar.

When the tube has been bent to the desired shape, apply heat or put it in an oven and the resin will run out into your original ladle. The resin can be used over and over again. All bicycle and motor-cycle handlebars are bent like this while cold. If resin is unobtainable lead may be used, but in this case put the tube first in a hot oven to make sure that the inside is absolutely dry or you may have a serious accident, moisture inside the heated tube may cause it to explode. Both methods have its dangers which must be guarded against. With resin don't overheat or it will set fire, with lead make very certain all your implements are dry as eyes can never be replaced.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

IN THE AIR *with a Miniature*

By J. D. ROBINSON.

Getting Aboard: a Dutch Air-Liner at Croydon.

WHEREVER I go I always take a camera with me, as I have often found that good pictures can be had on the spur of the moment, even perhaps when one is least expecting to make an exposure. Acting on this, I pocketed my miniature camera (one of those giving 16 exposures 4.5×6 cm. on a $3\frac{1}{4} \times 2\frac{1}{4}$ film) when I recently had occasion to go to Amsterdam by air.

The photographs I took *en route*, and which illustrate this article, are interesting as being a little out of the ordinary run of subjects, and, as the pictures show, the miniature will perform quite well as an aerial camera.

The film used was Panatomic—a fine-

grain panchromatic film of but moderate speed—but as the day was bright and the subjects mostly distant I was able to stop the lens well down and still give fast exposures, resulting in negatives full of detail. The high speed and, still more, the vibration of the aeroplane make a fast shutter speed very desirable for subjects taken in flight.

Ready to Start. Showing also the passenger's view.

The first, taken on the ground while passengers and baggage were being stowed away, was given $1/25$ th at $f/11$ in brilliant April sunshine. These air liners are bigger than they look, and the apparently small windows are, in actual fact, more than big enough to see or photograph through in comfort. The centre picture shows what I could see through the window nearest the seat allotted to me. This, taken at $1/50$ th at $f/8$, was exposed just as we were ready to start.

Once in the air, the shutter was speeded up to $1/300$ th of a second. For the photograph of the clouds, which shows the aeroplane alone in a vast, unfamiliar world of its own, $f/11$ was used, as the sunlight reflected from the bank of clouds below us sent light into even the darkest shadows within the field of view. Notice the impression of flying subtly conveyed by the altered angle

Suspended in Space. The Air Liner over Rotterdam.

of the aeroplane itself.

Of the other two photographs, both taken at $f/8$, that of Rotterdam gives, I think, the stronger impression that the aeroplane is high above the world. This is probably due to the fact that it was low enough for the houses to be seen individually. The map-like effect seen in the photograph of the canal somehow entirely fails to suggest height.

On some air liners photography is, I believe, prohibited—at least on certain routes. Enquiry as to this should therefore be made before using a camera.

A Dutch Canal stretching into the distance.

A Sea of Sunlit Cloud.

AN EVER-READY GRIP By DAVID CHARLES.

THERE are plenty of subjects which call for very swift action if they are to be seized. A minimum of time must be occupied in the act of aiming and focussing, or they will no longer be there to shoot. The mode of ensuring swift action must necessarily vary with the camera, as well as with the individual user.

Fig. 1. Holding a Multex camera and focussing on objects over 10 feet away.

The illustrations show how to achieve it with the Multex camera. That is to say, how to work the range-finder while keeping a finger at the ready on the trigger-button. The focussing knob is grasped between two fingers. This allows of only a small amount of actual movement, but it is sufficient for subjects within a certain range of distances, while at the same time providing a completely steady grasp of the camera for instant shooting so soon as the essential detail is focussed. In Fig. 1 one hand only works the camera, while the other steadies it. Held this way, subjects between ten and fifteen feet away can be comfortably focussed on.

For close-ups the focussing lever is worked with the opposite hand to the one which shoots, as shown in Fig. 2. It is quite obvious that it is never really necessary to have the whole circle of focussing movement avail-

Fig. 2. Holding the Multex for real "close ups" at about 3 feet.

able at any one time. By selecting the range of distances required, and adopting a grasp accordingly, the user obtains the definite advantages we have discussed. Naturally, it may take a little experiment for each worker to determine how best he can arrange his fingers upon his own camera, deciding which fingers shall focus, and which shall shoot. But these questions can be decided with an unloaded camera. Then the quick-fire subjects can be tackled with confidence whenever they crop up.

DEVELOPING WITHOUT TEARS

By COURTNEY BRYSON.

EVERY fourth-form schoolboy knows that unless the time-temperature curve is kept dead straight during miniature film development

"The subtle alchemist in a trice, will
The Two and Seventy jarring salts
conflate

And Light's silvern metal into grain
transmute."

In spite of recent statements that the temperature of the wash water does not affect the grain of Kodak film, I have proved that a difference of several degrees in the fixing bath temperature definitely increases the grain of ISS Superpan. There is always the further point that a difference of 3° C. (e.g. from 18° C. to 21° C.) means a 40 per cent difference in development time, so if serious development errors are to be avoided, it is absolutely essential to keep the temperature during development steady within plus or minus ½° C. This limit is easily achieved by my method.

A certain number of household utensils are necessary. In the first place, five glass milk-bottles are required—the ordinary one-pint size. I offer no advice as to how to obtain these. Whether it is better to make nocturnal or early morning excursions enveloped in a mackintosh with voluminous pockets, or more legitimately to develop a sudden enormous appetite for milk, with subsequent surreptitious descents to the kitchen, is a matter which may be left to individual conscience.

The next requisite is a large bath. Personally, I prefer one of a size just about large enough to hold a medium-sized pair of twins or a small set of triplets. These baths are ironically called tin because they are made of galvanised iron. The third piece of

Many readers will have dismal memories of hay-box cookery, as practised during the War. Hay-box development, to judge from this article, is a much more cheerful pursuit.

apparatus is a square biscuit-box. I obtained mine by walking into a grocer's shop and asking for it. This is all the actual apparatus required; though it is also necessary to acquire some hay. Send an enquiry to a farmer for ten tons of prime hay and request a 1-lb. sample. Select a far district and mention something about pet elephants.

The quantity of liquid required for most tanks is of the order of 400 c.c. This quantity is poured into one of the milk bottles and a note made as to the level of the liquid. It will be found to be level with, for instance, the top or bottom of the "U" or the "D"—that is if you deal from the same dairy as I do. No more measuring cylinders are now necessary. You can give it back to the man from whom you borrowed it as you will never need it again. The milk bottles are then filled up to the mark with the following solutions:—

- 1.—A 1 per cent solution of sulphonated castor oil (if you use it).
- 2.—Developer.
- 3.—Stop bath.
- 4.—Fixer.
- 5.—Wash water. The final wash water contains a few drops of acetic acid.

These are stood in the bath the temperature of which is adjusted to 65° Fahr. exactly. Meanwhile the biscuit-tin is filled with hay and the tank bedded

well down into it. By this time you have grasped the idea and it is scarcely necessary for me to proceed farther. If the room temperature is very much below normal then the first wetting-out bath may be raised in temperature a little by putting in some warm water and immediately pouring into the tank. It is allowed to stay for two minutes so that its temperature is finally 65° Fahr. The temperature will not drop more than ½° Fahr. during all the subsequent operations.

The lid of the biscuit-box can be lined with thick felt. If you work in an office you can easily requisition a new typewriter mat. A hole is knocked in the lid just big enough to pass the thumb and forefinger for twirling purposes. I use a Perkino tank, lie on the divan with the box at my side, facing the clock. My left hand hangs over the side and rests on the hay-box. My right grasps a novel, and everything goes merrily as a marriage bell with three slow light twirls every five minutes. Vigorous agitation increases grain. Two pints of water and two minute washes (vigorous twirls) are stated by Spencer to be sufficient. I only hope he is right.

Paraphenylenediamine is expensive. Instead of taking the amount of solution recommended by the makers of the tank, fill the tank with water with the lid off so that the liquid barely covers the edge of the film and measure this amount. The actual amount of developer I employ comes barely to the perforations. Of course, if you use the developer more than once this economy is unnecessary, but I question the wisdom of developing valuable film in a bath containing an unknown amount of stale developer.

Modern Miniature Cameras

THE BALDI.

THE Baldi camera belongs to the class of very small and portable miniatures making 16 exposures, each 3×4 cm., on an eight-exposure roll of standard V.P. film. The dimensions of the camera when closed are $4\frac{1}{2} \times 3\frac{3}{4} \times 1\frac{1}{8}$ in. over all projections, while the body itself is only $2\frac{1}{2}$ in. wide. The increase to $3\frac{3}{4}$ in. is due to the rather large winding-knob and the tubular finder, which are on opposite sides of the camera. The camera therefore looks considerably smaller than the overall dimensions would suggest. Its weight, complete, is but 12 oz.

As the illustration suggests, the camera is of the fixed extension self-erecting type, focussing by rotation of the front cell of the lens. In the model sent for review, fitted with a Meyer Trioplan lens working at $f/4.5$, the scale extends to five feet. As in other cameras taking this size of picture, the focal length of the lens is 5 cm.

In the model examined the lens is mounted in a Prontor II shutter, which is speeded from 1 second to $1/175$ th second. Speeds are adjusted by turning a ring surrounding the body of the shutter; this ring carries the index mark, which is placed against the speed desired. Unlike most diaphragm shutters, the Prontor requires to be set for Bulb and Time. For self-portraiture there is a delayed-action release, available on all automatic speeds, including the highest. The delay is about 8 seconds. The scale of lens apertures is on the top of the shutter where it can easily be seen.

The back of the camera hinges open for loading, and the two spool-chambers open automatically to accept or release the spool when they are swung out from the body of the camera. Loading is carried out in the usual way, and the film is wound on until the number "1" is seen through the first of the two red windows. The winding knob is fitted with a free-wheel and a stop, so that after turning it forward by a certain amount it has to be turned back against the free-wheel.

Semi-Automatic Film-Wind.

This device provides semi-automatic film transport, for by turning the knob first backwards as far as it will go and then forward to the stop, a definite amount of rotation is imparted to the take-up spool. Since the spool gets thicker as more film is wound on to it, the spacing between the pictures is not quite even; they are liable to overlap a shade at the beginning of the strip, and being rather widely spaced towards the end the number of exposures is reduced from sixteen to fifteen. This method of winding is nevertheless an extremely convenient alternative to using the red windows, and will be much appreciated when it is desired to make exposures in rapid succession, since it provides for an almost instantaneous advance of the film.

Correction for Parallax.

The view-finder is of the enclosed optical type, giving a clear image with well-defined boundaries. It is fitted with a tilting device operated by a disc graduated in distances; by setting this to correspond with the focussing scale, error due to parallax is corrected.

The red windows, of which there are two, as is usual in "16-on" cameras, are fitted with a sliding cover-plate to render the camera safe for use with panchromatic film.

A test film gave a set of crisp little negatives capable of producing excellent enlargements, and some sharp photographs of a diver, taken at $1/175$ th second, made it quite clear that the speed in question is genuinely fast.

The Baldi is available with a selection of lenses and shutters, prices ranging from £4 7s. 6d. when fitted with $f/4.5$ Vidanar in Vario 3-speed shutter, to £9 when fitted with $f/2.9$ Trioplan in Compur Rapid shutter. The model reviewed is listed at £6 2s. 6d. The camera, which is imported by the Norse Trading Co. (London) Ltd., of 37, Rathbone Street, W.1, can be obtained through any dealer.

Miniature Camera Gossip

By LANCELOT VINING.

A WELL-KNOWN photographer recently told me that a miniature camera always gives itself away by its verticals. Fortunately I had a number of freshly-made enlargements in my hand at the time, and from these I was able to pick at random the print of the Paris Exhibition, which I think you will agree proves him wrong.

To my mind, this photograph is a good illustration as to what can be done with a 2-in. focus lens and tiny film. At $f/11$ I was in focus from 8 ft. to infinity, and able to illustrate the lack of free seats for tired tourists, the workmen's litter and something of the Exhibition grandeur, which is what I was out to get.

Olive or Sherry?

The Champlin No. 15 looks like a developer which is going to cause any amount of argument when societies start their winter sessions again.

The report of a test made in this country, which threw down the claim that it increases film speed, was sent to Mr. Champlin in America, and his reply just received is in effect... Your developer was wrong because you state that the solution was a pale sherry colour, it should have been a pale olive green; when

FIG. 1. PARIS EXHIBITION.
2-in. lens at $f/11$, $1/50$ th sec., on Isopan F.

solution, will they be good enough to send me a P.C. giving the brand of glycin used, and where purchased, so that I can carry out further tests?

New Leica Lens.

This week-end I was able to use the new Leica $f/1.5$ lens, and although not in a position to make a scientific test, I can say that I think it a fine lens with very good definition at its full aperture. I tried it out on a number of subjects, including the street scene reproduced here, for which the camera was focussed on the advertisements.

Leica users will, in my opinion, be quite safe in making the outlay on this lens, and will certainly be acquiring a valuable instrument.

FIG. 2. THE NEW LEICA LENS.
Taken at $f/1.5$, $1/1,000$ th sec.

checking samples which fail to produce the results claimed, I have found the glycin to be the prime offender, and often a change to another brand sufficed to produce the desired result.

Mine, which did not increase film speed, was pale sherry, and seeing that Lewis was selling No. 15 in concentrated solution, I 'phoned and asked the colour and received the reply, "Pale brownish green." This sounded more hopeful, and a quick non-comparative test suggested that the results were better.

But fancy having to buy developer according to colour!

If any readers have made up this developer and obtained a pale olive

TEN GUINEAS AND UNDER

A Section for the User of the Inexpensive Miniature.

The V.P. Camera on Holiday

By F. A. MAITLAND.

FOR the size of picture that it takes, a folding camera making the normal eight exposures on a roll of standard V.P. film is probably the lightest and most compact of all the larger miniatures. On a holiday, particularly one that is spent in the com-

a square inch of the original negative. Such photographs as this can provide a very pleasant memento of the end of an enjoyable day.

The harbour picture is a holiday photograph of more usual kind, and is enlarged from the whole of the negative.

As the lighting shows, it was taken late in the evening, so necessitating a large aperture. The characteristic depth of focus of the miniature has come to the rescue here; with no tripod, a larger camera might well have failed to secure this picture without unpleasant lack of sharpness in either foreground or distance.

Besides being invaluable during the usual annual holiday, the miniature is an excellent companion at the brief holiday which every week-end provides. Being interested in cycling, I have made many week-end exposures like

that reproduced, taken late on a dull afternoon. The riders were sprinting at nearly 30 miles per hour, and as the rapid movement of the riders' legs makes swinging the camera of no avail, the highest speed of the shutter, $1/3000$ sec., had to be used in spite of a poor light. The result is, I think, satisfactory, and I find it very encouraging that cycling prints taken with my V. P. miniature have been accepted by the Press on more than one occasion.

THE END OF A DAY'S TRAMPING. $F/3.9$, $1/100$ th sec.

pany of others, portability is a great asset; it is not very comfortable to scramble over rocks and breakwaters with a camera case swinging from the shoulder, and threatening to dash itself suicidally against the harder and more knobbly parts of the obstacle one is surmounting. In the pocket it is safe, so "pocketability" is a very great virtue in any miniature taken as a holiday companion.

Like other "large miniatures," the V.P. size camera provides its users with negatives big enough to give contact prints which will be accepted by the non-photographers of the party as adequate mementoes of the occasion.

The particular V.P. camera that I use is an Agfa Speedex O and I have used it for all sorts of subjects besides the usual kind of holiday ones. The portrait taken in the bus—without the subject's knowledge—was given an exposure of $1/100$ th sec. at the full aperture of $f/3.9$, and was taken at about 8 o'clock on a June evening. It is an enlargement from an area of little more than half

LOW TIDE.

THE FINAL SPRINT. $1/3000$ th sec., no camera swing.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

CHOOSING A CAMERA.

Would you kindly assist me in the choice of a suitable miniature camera at a price of from £5 to £10? I have no experience of any but a cheap box camera, but four friends have recommended to me four different cameras in the 3×4 cm. size. One has no slow speeds, and the other three, while much alike in general specification, differ rather widely in price.

B. L. (Chiswick.)

We are sure you will not take it amiss if we tell you that in our position it is quite impossible for us to discuss the merits of rival makes of cameras, though we are always ready to discuss the advantages and disadvantages of the various types of camera for any particular purpose, or to tell a reader what cameras are in existence to fit any specification he may care to lay down. In your case, where all four cameras are of the same type, we can only remind you that a camera at a higher price is generally not only a better camera, but a better investment. As for the matter of slow speeds, we ourselves would feel rather handicapped in using a camera with which they were not available.

LENS FOR ENLARGING.

For enlarging from 35-mm. negatives is there any serious disadvantage in using a projecting anastigmat of relatively great focal length—say 120 mm.? I have used a 120-mm. Tessar up to the present, but wonder whether I could get even sharper results from a 50-mm. lens.

J. T. D. (Northwood.)

Apart from the extra "throw" required, the only objection to the use of a lens of long focal length for enlarging from miniature negatives is that, in general, these longer focus lenses do not give quite such minute accuracy of detail as those designed to give the very high standard of definition required for miniature work. But there is no doubt that a 120-mm. lens of first quality would give better results in this connection than a 50-mm. lens of inferior corrections.

TELEPHOTO LENS.

I have a Reflex-Korelle for which I have just bought a telephoto lens. Could you tell me (1) What film is best for distant views, groups of buildings, etc.? (2) Should I give a longer exposure with the telephoto lens? And (3) is a No. 1 yellow filter advisable?

F. C. H. (London.)

You do not need special negative material for the kind of subjects you mention, nor does a telephoto lens make a longer exposure necessary than would be given with any other lens at the same aperture. Apart from the fact that the telephoto lens gives a larger image, and so will make any possible camera-shake at the moment of exposure more evident in the negative, there is no need to treat it in any different way from a normal short-focus lens. All you have to do is to get a sharp image on the screen and expose correctly, and your results will be completely satisfactory in every respect.

BOUGHT SECOND-HAND.

I have just bought a V.P. camera, but I am puzzled by the markings on the side of the lens. They are 11, 16, 22, 32, 45, 1 3 T. On the lens is written "Objectif Sphinx Extra Rapide." Could you enlighten me, please?

C. G. (London.)

Your camera appears to be of French origin, and the series of numbers beginning with 11 seem to be the f numbers of the stops. The last three symbols are almost certainly not 1 3 T, but I. B. T., these letters standing for Instantaneous, Bulb and Time. If you experiment with the shutter with the lever set at each of these positions, you will soon discover what they mean. We do not know the make of the camera.

CAMERA REPAIRS.

I have a miniature camera and wish to refix the view-finder which has become loose as the result of a knock. To do this I shall have to take off the top plate of the camera; can you tell me how to go about this?

R. H. W. (Renfrewshire.)

We would strongly advise you to put your camera in the hands of a skilful repairer to have the work done, or to send it direct to the makers for repair. If the finder is to be accurate, it will have to be refixed in exactly the right position, and dead straight, and this sort of thing is best left to those accustomed to such work.

Before the Holiday Rush

By D. SWAINE.

THE August Bank Holiday in this country always appears to be the signal that lets loose the great hordes of holiday-makers who throng the seaside resorts and the countryside during the month that follows. But there is a lot to be said for holidays not taken in August.

If it is the only time of year that the amateur photographer is able to secure for a vacation he is apt to be swept up in the great rush, and his attempts at picture-making will be handicapped by other holiday-makers all around him. If he can choose his own time, July should be the very latest if he wants to avoid the crowds, and the earlier the better.

It is true that there exists an air of gaiety about the height of the season in August, and that it is possible to obtain a type of picture peculiar to the period; nevertheless there are innumerable exposures to be made, on what are essentially holiday subjects, during an earlier month. The very fact that the early season at any holiday centre is a quieter time may even be the making of certain pictures.

Sunlight in Old Exeter. F/5.6, 1/25th sec., Verichrome film.

both photograph and temper.

In our numerous small ports and fishing harbours there is always some local activity which can be turned to account. Here again an earlier holiday is often an improvement on a later one, for it may be that the overpopularity of a particular place is a drawback to the photographer.

In one particular we must all agree—the length of time available for photography in any one day is greater in July than in August or September, and the countryside, if that be the photographer's main objective, still has some of the sparkle and freshness of late Spring, which will be long past by the time the middle of August has arrived.

A Country Lane in July. F/6.3, 1/50th sec., Verichrome.

To take that most popular of all holiday photography, sea-shore snaps of friends and relatives with the kiddies. It is all to the good that the beach is less crowded than later. Seaside crowds have often provided splendid human pictures for the photographer, but the absence of these only leaves the sand more clear for the careful arrangement and thoughtful composition of our child studies. When the crucial moment for the exposure arrives it is a great relief that there is no likelihood of anyone running into the picture and so spoiling

The Sunlit Chine. F/4.5, 1/25th, S.S. Pan.

grapher's main objective, still has some of the sparkle and freshness of late Spring, which will be long past by the time the middle of August has arrived.

A beach snapshot in early July, free from the holiday crowd.

Photography in High Key

By FRANK C. PALMER.

IN spite of the very beautiful effects which can be obtained in high-key photography, examples of this type of work are comparatively rare. This rarity is no doubt due in some measure to the restricted range of suitable subjects, but still more is it due to the impression that high-key work is very difficult.

This is not so, and any amateur who can make a good negative and a good bromide print can produce a successful high-key picture.

By high-key photographs I mean those pictures in which the range of tones is restricted to half and quarter tones, with nothing deeper than a medium grey; such studies tend to have the appearance of delicate pencil sketches, but they have, of course, a definitely photographic quality and are not by any means a poor imitation of another medium.

High-key studies can be divided into two classes, and these two classes require rather different treatment.

In the first class the subject to be photographed is itself in a high key, with no deeper tone than a medium grey. These are given a generous exposure, the plate is developed for a normal time, and the final print is made on a soft grade of paper, giving the print a short exposure and full development, to avoid getting a flat or muddy effect.

The other class of high-key work includes subjects with a fairly normal range of tones, which the photographer wishes to render into high key, in order perhaps to suggest a mood of nature by a light, delicate impression of the subject.

An extreme case of this type is the ordinary street scene, which with normal treatment would give the usual

STREET SCENE, ARMAGH. Early morning, $f/8$, $1/25$ th sec. Ilford H.S. Pan., developed half normal time in Rytol. Print on Kodak Platino Matt Smooth Bromide, developed in dilute Azol.

PETER. Exposure, 12 grains Johnson's flashpowder, at 5 feet, $f/8$. Ilford S.G. Pan. Developed half normal time in Rytol. Print on Kodak Platino Matt Bromide, dilute Azol developer.

full range black-and-white print. To make a high-key picture of such a subject, the plate or film is given full but not excessive exposure.

It is developed, preferably in a "soft working" developer, for not more than half the "normal" time for such a subject. The time and temperature method of negative development is by far the most successful for this type of work. The final print is made on a medium or soft paper, with restricted exposure and developed in a soft working solution such as dilute Azol or Rodinal. Development is stopped as soon as all detail is secured in the high-lights and before the shadows darken.

This second method can be used for all high-key work, and is in fact adopted by some workers for all subjects of this type. In either case, the most suitable paper surface is a smooth matt, with a white or, preferably, ivory base; rough textures or a cream base destroy the delicate balance of tones.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXCIV.

Mr.

T. Y. YOUNG.

From information communicated to our Special Representative.

"TEN years ago, when I was fourteen years of age, my mother purchased a V.P. Kodak for me, and included with this the dealer offered a short, simple guide to photography. After thoroughly studying this small book, and under the instruction of my elder brother, I ventured to expose my first roll of film with great enthusiasm. My interest was still further increased when the result showed that my first attempt was not at all bad.

"Since then I have never left my little instrument alone; I expose at least one or two rolls of film almost every day. Up to the present I have stored more than 8,800

negatives, and each one is accompanied by a record indicating the date, place, scene, time of exposure, aperture and other particulars. By so doing, mistakes of the past can easily be corrected in the future.

"During the time when I was studying I seldom had a chance of going out of town to find subjects for my camera, and therefore most pictures of my earlier work were taken in my own garden. On account of this limitation I always took pictures of every possible subject from different angles, and under various conditions of lighting, in order to make experiments in regard to both the technique and the composition of photography.

"I am always grateful to Nature. It is my main subject for making pictures. Most of my prints represent natural scenes. From my point of view these natural scenes are in motion day by day and minute by minute. The subjects are everlasting; at any time when sunlight gives us the opportunity we may obtain beautiful pictures.

"I now have three other cameras, namely, a Super Ikonta, a Rollei-cord, and a Leica with an f/3.5 Elmar and a 3.5-cm. wide-angle lens. The Leica accompanies me almost every day when I am going out.

"My favourite film is E. K. Panatomic, which I develop in a tank with D76 developer. Once I have become familiar with the character of a film, and with the action of a developer, I seldom make a change. During the processes of developing, fixing, washing and drying, I carry out the work with extreme care, and take special precautions against dust falling on the film while it is drying.

"I use two enlargers, both of condenser type; one for 24×36 mm. negatives, and the other for 6×6 cm. negatives. The enlargements are made either on Kodak Vitava Opal, or Agfa Brovira with D64 developer.

"I am always a regular reader of *The Amateur Photographer*, from which I get a great deal of valuable information; and I am glad to be able to tell its readers that photography in China is developing prosperously all over the country."

(A further example of Mr. T. Y. Young's work is reproduced on one of the centre Art pages.)

THE OLD WOMAN.

T. Y. Young.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"THE AUTOGRAPH ALBUM," by Raymond H. Dudley.

COHESION, in a figure study of this kind, is a very valuable adjunct. It should extend both to the arrangement and to the mood or action in which the subjects are shown, and in the first respect the placing of the figures is excellent as far as the quality is concerned, but, naturally enough, it is affected by the second.

The male figure (1) is the most important element of the group. He maintains his priority not only on account of his strong placing in the picture space, but also on account of his proximity, larger scale, and the fact that more of him is seen than any of the others. The next figure (2) fulfils but a slightly subordinate function, and there is a visible junction between the two outlines, besides which the two figures (1) and (2) are engaged in a common action. The third element (3) is of considerably less significance. Her scale is smaller than that of the other two, and while, by her fortuitous inclusion in the group, she is connected with them, her action in looking out of the window is entirely dissociated.

The actual and existing connection between the three elements establishes cohesion between them as far as the composition is concerned, but, in respect of the mood, cohesion only is in evidence between the first and second and not between them and the third. The latter, very evidently, has nothing to do with the first pair.

So, while it seems that the group is physically well arranged, in the spirit it is out of harmony—and not only out of harmony, but pose and expression in the third element seem to indicate an intention to remain aloof and to show a deliberate detachment. It is all very well, no doubt, to be wise after the event, but I know, from having attempted a similar sort of thing myself, that subjects of this type are tried on the spur of the moment and on the chance that

something might be made of them. If the chance is missed there is always a feeling that a good thing may have been lost, and if they are not taken as the opportunity arises it may pass for ever.

The first two figures are good and exceptionally well caught, and in similar circumstances I think I should have made an exposure just as has been done in this case. I would, however, have waited a bit—to see

image would need to be lightened—after the ink had dried. Alternatively, a transparency could be made from the untouched negative and all the lighter tones filled in to match the adjacent values.

For example, the lights on the face could be subdued till they matched the tone of the curtain and wall behind. I think, too, that it would be as well to lower the tone of the wall to the same value as the dress to avoid

the necessity of doing a great deal of work in trying to retain the pattern. It could be shaded off into those portions where the pattern exists and need not be extended beyond the printed notice on the wall. The red dye—neo-coccine, which is made for the purpose—would be useful for this part of the work, and is quite easy to apply.

From the adjusted transparency, another negative would need to be made, on which all the tones which appear dark on the print and which are lighter on the negative could be similarly evened out. Then, when everything seems complete, a trial print should be made and any little discrepancies which may then come to light may be treated and corrected, either on the positive transparency or on a fresh negative, as the case may need. The final enlarged

print can now be made in the process selected for the purpose.

It should not show any trace of the working-up, and for all practical purposes should exhibit all the quality of a straight and purely photographic print. The method has the advantage that the original negative remains untouched and that, if either of the two stages does not come up to standard, it can be scrapped and the process repeated until the precise effect desired has been obtained.

"Faking" it is without a doubt, but if this print can be imagined without the unwanted third, it needs no other justification. "MENTOR."

either if the third element would dispose herself more favourably or move out of range—and, if I had the chance, would take another, using whichever proved the better for the final print.

Should, however, the second chance not be presented, I should be inclined to have a shot at removing the third figure altogether. It would not be an easy job, but it could be done, and in a way that would defy detection, particularly if a control process, such as bromoil, were employed for the printing medium. With it, quite a large proportion of the blotting out could be done during inking up and the remainder—mainly where the

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

WHEN a subject seems to sit quite comfortably in the picture space—as it does in No. 1 of the prints on the opposite page, “Barges Loading,” by Mrs. H. Rounthwaite—it may be taken that there is nothing flagrantly wrong with the arrangement of the composition.

Sitting Pretty.

For once in a while an Americanism aptly hits upon the characteristics of the subject. It “sits pretty” in the pictorial boundaries, and shows quite well that the scene has been carefully chosen.

In minor matters there may be, perhaps, a need for adjustment, but not much, and on the whole the arrangement is perfectly acceptable. I am not too sure, however, about the wisdom of including that bit of bank on the left, for its shape is not good and it makes an awkward line. It would, if it were more assertive, seem to cut off that corner from the rest of the picture, but, as it happens, its tone is not aggressive and that undesirable effect is avoided.

Sometimes it is possible to exclude a corner of this type by advancing the viewpoint a trifle, but whether it was so in this instance or not is not disclosed by the rendering itself, and the point is one that could only be decided on the spot.

The clouds help to make the setting very attractive, and, having regard to their fine form, it would have been better if just a fraction more space had been allotted to the sky. It would mean, of course, that the foreground would have to be reduced by the same amount, and, as that consists of very pleasing reflections, it is easily understood why so much of it is included.

Picture Proportions.

Still, at the present time, the sky and landscape, although they are not actually equal, seem rather too equally divided. One or other should predominate and neither does to a sufficient extent.

It would scarcely be feasible, with the subject disposed as it is, for it to be turned into a foreground study pure and simple, and to do so would be to invite a charge of seeking notoriety through eccentricity in arrangement, so that, to bring the picture proportions into a pleasing

relationship, it is the sky that should be extended and the foreground reduced.

Even in No. 2, “Secluded Cove,” by W. M. Richardson, where the line of the horizon is definitely lower, it might be placed yet lower still with advantage to the composition.

Here again the sky proves the main attraction, and the foreground is by no means as interesting as in the former case. Adding a quarter of an inch to the sky and removing a similar amount from the base adjusts the proportions satisfactorily and enables the sky to dominate the subject as it should.

On the other hand, a scene like No. 3, “From the Top of the Empire State,” by Miss Evelyn Williams, could, by reason of its high viewpoint, only be treated as a foreground study. Its horizon is necessarily raised; nor, with such a subject, is it within the range of practical politics for it to be treated in any other way.

The High and the Low.

It would, however, be considerably more effective did it show one of the buildings more definitely isolated from the rest. At present there is not one of them that stands out well enough to entitle it to be regarded as the centre of interest, and without something to fulfil that function a picture seems uninteresting and without point.

For a similar reason, No. 6, “Trees and Clouds,” by J. G. Young, also seems rather motiveless. Neither one of the trees nor any particular cloud stands out from the rest and there is nothing to localise the attention. It differs from the former subject in that the line of sight is directed upwards instead of downwards, but there is no reason why any departure from the normal way of looking at things should be chosen if the subject does not provide a self-evident justification for such a course.

And it does not in either of these cases. One represents a subject seen from a high viewpoint, and the other one from a low, but there is no virtue in that, nor is there any pictorial attraction in either. Nos. 1 and 2, without any deviation from the normal, very plainly succeed in attaining a much higher artistic level.

With No. 4, “Haymaking,” by B. Freeman, the viewpoint is rather too near, for one thing, and too little foreground has been included. The figures here do not “sit pretty” in the picture because they have not sufficient ground to stand on.

Too Little or too Much.

It may be that the finder of the camera is out of truth, or the instrument itself may have been jerked upwards at the moment of exposure. If the latter, care should be exercised to maintain the proper line of sight, and if the former, the instrument should be put into dock for repairs. In contrast, No. 5, “Ysgubar Newydd,” by H. Crosby, suffers from an expanse of unneeded foreground.

Fully three-quarters of an inch could be cut off from the base without detriment to the essential elements of the subject, and either the viewpoint might have been advanced a trifle or the subject could have been taken as a horizontal instead of a vertical.

Judging from what is visible, the latter would seem the better alternative, but, both in this case and in No. 4, the sky tone is regrettably deficient.

The difference that would be created can be imagined if these subjects were shown with a sky such as is included in Nos. 1 or 2, particularly if the adjustments to the foreground were also carried out.

Tone and Modulation.

Except that the subject is better arranged and there is no need for any adjustment to the foreground, similar remarks apply in the case of No. 7, “Fisherman's Cove,” by Miss P. Storey; but here the print has something of that bleached-out appearance that comes from over-development of the negative for the contrast range of the paper on which it is printed.

The choice of a softer grade of printing paper would not only avoid this appearance, but would also enable a decent amount of tone to be included in the sky, without of course involving an overprinting of the darker tones.

The subject selected is far too jumbled and confused to be satisfactory, and it is quite unsuitable as an entry in a competition which always attracts much work of a higher standard.

“MENTOR.”

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

NARROWING DOWN THE SUBJECT.

JUST recently I explained how, up to a point, the beginner can dispense with a supplementary lens of longer focus than that fitted to his camera. All that is necessary is for him to use only that part of the subject which the longer focus lens would have included, leaving out all the extraneous matter which the shorter focus lens would also have shown.

I now intend to look at almost the same idea from a rather different angle, and to help me I have made the three illustrations herewith. They were all taken within a very small radius, and inside ten minutes, with a $3\frac{1}{2} \times 2\frac{1}{4}$ roll-film camera, which has about a quarter-inch rise to the front for the vertical way only.

Fig. 2, taken against the light, is rather too contrasty in the reproduction, but it is the selection of subject to which I

wish to refer. It is the sort of general view most of us take hereabouts, and it conveys a very fair idea of the appearance of Trafalgar Square on a sunny day. If we came across the same sort of subject abroad we should certainly take it just the same, and show it as a record of a place visited. And rightly so; for securing such records is one of the chief reasons for carrying a hand-camera at all.

But having taken such a general view we should not conclude that all is done that can be done. We should then narrow down our outlook, and see if we cannot find something more restricted and yet interesting. Thousands and thousands of people every year take extensive views of Trafalgar Square, but how many photograph separately the lamps that were once the stern lights of Nelson's *Victory*? They are here.

Not far away stands the memorial to Nurse Cavell, shown in Fig. 3. Here I raised the front of the camera as far as it would go, but I had even then to point the lens upwards a bit, and the distortion is evident. In using only a part of the negative I have made the building on the right vertical, and thrown all the error on to the tower of the Coliseum; but this is a case where the distortion is so slight that it can be easily corrected by a slight tilt during enlarging.

In the original print the features and detail of the figure are good, the difference in the colour of marble and limestone is evident, and there are clouds in the sky. So that a carefully-made enlargement gives a reasonably good

Fig. 1.

Fig. 2.

version of a subject which is really more interesting in many ways than the more extensive view in Fig. 2. It is the sort of thing, though, that is awkward to take with a hand-camera, because of the constant passing of vehicles and pedestrians; and when a promising moment arrives the shot has to be made very hastily. Then we find that the aim was not true, or the camera askew, or that there is evidence of camera shake.

The subject shows at least two opportunities for narrowing down—the figure alone, and the design at the top; and there is another separate subject at the back.

Fig. 1 shows a still more drastic example of narrowing down the view-point. Some readers may remember another version of this subject I showed as one of the test exposures with a miniature camera. This is an improvement. In this case I had a longer focus lens, so that I could stand farther back and still get a larger image. Doing this, and having at least a little rise to the front, I did not have to point the lens up so much. I have got the subject entirely against the sky, and have been able

Fig. 3.

to exclude a tall and tilted building that comes immediately outside the right-hand edge of the print.

Personally, although some may not agree, I think this bit of decoration is well worth recording. It is one of the few ornamentations of the great South Africa building on one side of the square, and is finely gilded. The animal itself is almost completely realistic, but the conventional decorative wings and the foliated support combine to make a harmonious design that I consider most beautiful, and therefore surely a worthy subject for the camera.

This is narrowed down in a very literal sense. I think that the narrow panel includes all that is required, and no more. It conveys an impression of height and dignity, and a narrow upright panel aids in producing such an effect. I would strongly advise the beginner to consider this question of masking or trimming, irrespective of conventional shapes and proportions. It is so important that I will refer to it further; but not next week, when the issue will be a gorgeous Summer Number.

W. L. F. W.

A Prize Competition for Novices

THIS competition is specially for Novices, that is to say, those amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

Our readers who are Novices have all the summer in which to make their prints for this competition, and the prizes are worth having.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 30th. This will give new readers who are Novices, and who intend entering this competition, every opportunity of improving their work during the next three months by reading *The Amateur Photographer* every week and obtaining their competition prints during the summer holidays.

The copyright of all prints entered remains the property of the authors of the photographs, but the right is reserved by "The A.P." to reproduce the winning prints and any others that may be worthy of mention.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Further reference to the competition will be made week by week, and hints given for dealing with the various subjects.

NEXT WEEK. "The A.P." Special Summer Number. Order Early.

MAKING BETTER SNAPSHOTS-6

By DAVID CHARLES.

This article is the sixth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. A "guide-book" photograph of no personal interest. A picture-postcard would do as well—or better.

Fig. 3. Another example of the "happy memories" photograph, likely to be treasured by all the five people concerned.

Fig. 4. The proud proprietor in front of his hotel, or a happy guest? If this picture has a story, it quite fails to tell it.

"THAT'S where we stayed," represents the notion of thousands upon thousands of photographs which will be shown around at the close of the present holiday season. There is no pretence, in these snapshots, of picture-making as such. They are intended, purely and simply, to represent to those who did not go, or at any rate did not go just there, what a good time was had by all. Many of these holiday-record snapshots are made by those to whom the event really was a special event, either by reason of its being an unusual occasion, such as a honeymoon, or because the place visited was unaccustomed.

If we took the trouble to probe into the deepest mysteries of the human soul, we might find that the act of displaying snapshots of a holiday is very similar to that of other forms of display, in that its object is to arouse a mild, but not dangerous, form of envy. "Don't you wish you'd been there?" is at any rate the message that the pictures are intended to convey. But how many do convey any such notion, or even a whisper of it? How many snapshots produced by holiday-makers ever do succeed in eliciting just that enthusiastic "I wish I'd been there with you!"?

Certainly not Fig. 1! Yet all too many holiday-makers do photograph the notable-buildings-à-la-guide-book! Why they do, heaven only knows, since they can get better views of these same spots for a penny at the nearest picture post-

Fig. 2. Of no particular interest to outsiders, this type of photograph is for those concerned a permanent memento of a happy day.

card kiosk. I must admit to being Philistine enough to believe that records of a holiday which you-and-I spent together should have either you-or-me in at least most of them. In that sense they ought to contain a recognisable portrait. Otherwise the picture will be a picture, perhaps; but not a memory of enjoyment. That is not to say it must be all portrait, either, or it will show you as you were, but will have no apparent connection with the holiday.

My second illustration was never intended to be anything other than what it obviously is, a snapshot of this gentleman taken by his wife (note her hand-bag left on the seat beside him) as they rested by the roadside. But to me it shows just enough of the view to suggest the welcome peacefulness of that particular spot. In that way it shows quite clearly in what way those two passed that day, and why they thought it pleasant enough to record, for future days to recall.

A Splendid Holiday Record.

In similar, but even more forcible fashion, No. 3 tells its story. Will it need many words, in many years to come, to describe how the ladies rested by the stream and guarded the commissariat, while little Mary coaxed Uncle George (can't you see it's Uncle George, even though his face is turned away) to climb the rocks after adventure?

I have no patience at all with things like No. 4. The hotel may have been notable for its ornateness, and the gentleman may have spent a really happy time there, or he may be the proprietor, for aught I know. Just to stand there in the sun to be photographed conveys just nothing at all. It is not a "portrait," nor is it a picture of a happy day; nor does it more than very faintly suggest that the place was remarkable for its magnificence. I am sure there was a reason for making that particular record. I am equally sure that the picture could have conveyed it. But it does not, and so represents no more than another wasted film.

WE GUARANTEE

the optical and mechanical perfection of all apparatus leaving "202." Even if anything SHOULD escape the eagle eye of our mechanics, that guarantee protects you in the unlikely event of the camera having an inherent, but previously unnoticed, defect.

The following used miniatures may be purchased from us with that same feeling of safety that you would experience when buying a new camera. In fact, you may have more confidence in these cameras since, in addition to being covered by our guarantee of optical and mechanical perfection, they have already grown up in active use.

WE DON'T WANT

your Christmas pudding! There are all sorts of ways of disposing of that, but there can be no doubt that the best way of disposing of your unused or unwanted "miniature" is by selling it to R. G. Lewis.

COMPARISONS

with such a fine piece of work as the Rolleiflex cannot but be favourable ones! We would like to embark upon a long and eulogistic essay in praise of the Rolleiflex cameras, but, space not permitting, will content ourselves with offering to send you a brochure dealing with them. Send for it to-day, and learn what the Rolleiflex and Rolleicord cameras can do for you.

Rolleiflex 6×6 cm., fitted f/3.5 Tessar and Rapid Compur shutter£25 0 0

Rolleiflex 4×4 cm., fitted f/2.8 Tessar and Rapid Compur shutter£26 0 0

ARE

you treating your photographic ability fairly? For instance, is the camera you are using doing justice to the knowledge that you possess of the photographic art? If not, then fie! Shame upon you for so ill-using your precious talents! Go thou and invest in an Ikonta, and give that matchless brain of yours a chance to show that your present poor results are the fault solely of your present poor camera!

Ikonta II, fitted f/3.5 Triotar and Compur shutter£15 12 6

Ikonta II, fitted f/3.5 Tessar and Compur Rapid shutter£20 10 0

ODIOUS

though it may be to broach the subject of filthy lucre, yet, if the purse or the family money-bag bulges rather less than you could wish it to, then there is still a twin-lens reflex with a really high specification waiting for your use. The young brother of the Voigtlander "Superb" salutes you; it really is a "Brilliant" camera in more ways than one!

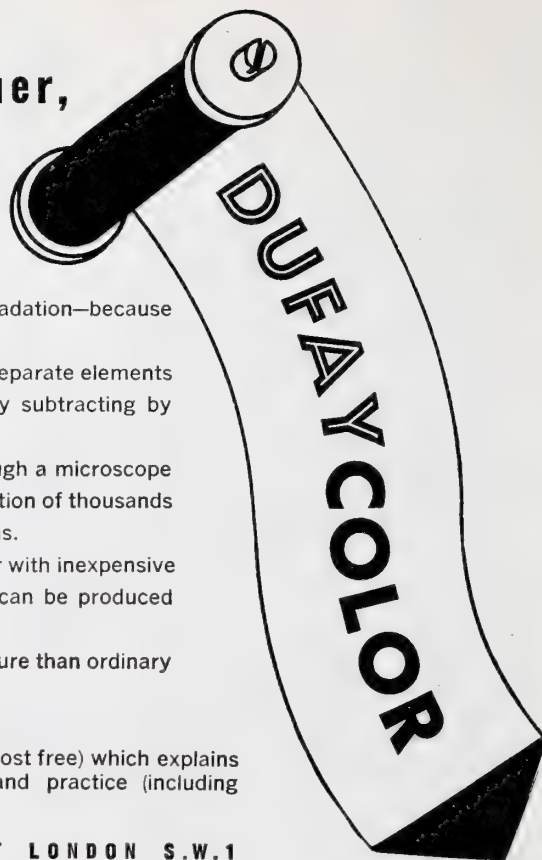

Brilliant, fitted with f/4.5 Skopar and Compur shutter£5 15 0

Brilliant, fitted with f/4.5 Skopar and Compur Rapid shutter£6 15 0

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780) (Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

The 'additive' process means truer, more brilliant COLOUR

Dufaycolor gives you brilliant results without filters; exquisite gradation—because it is based upon the "additive" process.

In other words, the colour tones are obtained by **adding together** separate elements of the primary colours (red, blue, and green), rather than by subtracting by means of filter layers.

Every colour is alive! Look at a Dufaycolor transparency through a microscope and you will see that its brilliant tints, its subtle hues, are an addition of thousands of elements of red, blue, and green light, in varying proportions.

Dufaycolor is a **fast** film permitting action snapshots in full colour with inexpensive lenses. Duplicate transparencies, and black-and-white prints, can be produced in any quantity.

Put Dufaycolor in your camera. It costs but little more per picture than ordinary film, and it is made in every size. Buy a roll today!

THE DUFAYCOLOR BOOK

Please write for a copy of this book (price 8d post free) which explains precisely and non-technically the theory and practice (including processing and finishing) of Dufaycolor.

DUFAY-CHROMEX LIMITED 14-16 COCKSPUR STREET LONDON S.W.1

ROBOT

'THE CAMERA THAT THINKS FOR YOU'

ROBOT in name—and action, that's where the Robot is the **different** miniature, for loaded—a few turns of its knurled screw and it leaves your mind free to get your pictures. You can 'shoot' at 4 a second—never a possibility of double exposure, Robot automatically winds on. Its 'zone' focussing gives needle-sharp definition every time.

COLOUR WORK—JUST WHEN OCCASION ARISES

A special subject—and you can change your film—you can put colour films in to-day, go back to 'pan' tomorrow—with the loss of only 2 frames. That's only a few ROBOT advantages—there are more.

Write to-day for full details—see below.

Comparative Photographs

By LESLIE SANSOM.

ONE of the most interesting of photographic pastimes is the making of what I call comparative photographs. These are pairs or series of pictures of scenes or objects taken from similar viewpoints, but under totally different conditions of lighting, weather or time.

The most common example of this work is the series of pictures depicting the same scene through the seasons. Most common because it is most obvious, and because they are the easiest to obtain and give the greatest scope to the photographer.

Everywhere there are scenes that make equally attractive pictures in the depth of winter, with the ground thick with snow, and also when the sun blazes down from a cloudless sky in midsummer. Such pictures are easy to take, and can often be very amusing, the contrasts of weather and temperature often producing the most humorous results.

Seaside pictures, with holiday-makers lazing in the sun in August, and then with fierce waves beating against the deserted promenade in January, make picture series that provide a pleasant change to the usual holiday snapshots, and that will brighten up an otherwise dull snapshot album.

Daytime and night pictures form another effective series, especially of floodlit buildings. A picture of an historical building photographed during the daytime is very often merely a record, but when a picture taken from the same viewpoint at night is mounted alongside, the comparison of the two gives that little difference that is sufficient to interest the layman who would find no interest in the pictures as records.

Again in the big towns, street scenes provide good material, first with a mass of humanity during the height of the rush hour, and then on a Sunday afternoon, almost deserted.

Winter.

Summer.

the golden-brown carpet of the Fall.

When you are showing friends the family snapshot album they would be much more interested if, instead of the usual holiday snapshots, you show them a picture of the family sun-bathing during the vacation, with, alongside, a picture of the same people sitting close to the fire in winter.

When such events as the Old Cocks' race are in progress, it is often possible to get two contrasting subjects in the same picture, as the most modern luxury cars are to be seen touring alongside the vehicles of bygone days.

Incidentally, these pictures have a definite market in the illustrated papers and afford great opportunities for the "free lance" amateur photographer. Opportunities for comparative pictures and series occur on all sides, and only need a little thought for the first one to be secured at once.

Night.

Woodland scenes provide endless opportunities for this work. Imagine the effective appearance of four pictures taken through the seasons. A massive oak, heavily laden from a fresh fall of glistening snow, an avenue of beeches, with the delicate etching-like tracery of the naked branches in Spring, the richness of a leafy chestnut in Summer, and

Morning.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

Re STOP BATHS, ETC.

SIR,—Generally some sort of stop-bath is suggested for use with gaslight papers in order to prevent staining due to oxidised developer. Either potassium metabisulphite or acetic acid is recommended for this purpose. I wonder if anyone has mixed these two ingredients in order to make a stop-bath? The result seems to justify itself because no staining will take place even if the print is somewhat over-developed due to under-exposure in the first place. I suggest the formula:—

Glacial acetic acid	1 oz.
Potassium metabisulphite	2 drs.
Water to	15 oz.

After development the print is rinsed in the above solution for about 10 secs., and then the excess stop bath washed off in water and then fixed in the usual way.—Yours, etc.,

J. R. TOTTLE.

CLUBS IN N.W. LONDON.

SIR,—I notice that in a recent issue of "The A.P." you have inserted a note to the effect that the Hon. Sec. of the Willesden P.S. has notified you that that club is serving already an area defined as "N.W." London.

This, I gather, is because the Hon. Sec. has misread the note you published regarding the N.W.L.C.C. as being the only club in N.W. London, whereas our intention was to point out that it is the only club covering those districts surrounding Hampstead and Hendon.

May I mention that it is not our committee's wish to antagonise the Willesden P.S. in any way—in fact, we have taken great pains to point out that their club exists to those members who come from that direction. It is our sincere wish to co-operate in any way with our neighbouring clubs, and the attitude taken by the Willesden P.S. appears to be rather extraordinary, especially in view of the fact that our membership is already approaching thirty-five—surely good enough indication that another club is needed in N.W. London, and particularly in these districts.—Yours, etc.,

RICH. C. FARRAND.

SODIUM CARBONATE.

SIR,—In the reply to J. E. (London) under "Readers' Questions Answered" of May 26th, it is stated that commercial carbonate of soda costing 1d. per lb. is not sufficiently pure for photographic use.

In order to determine the exact composition of this commercial soda, I selected a fresh sample free from any white powdery coating and analysed it. My results showed it to

contain 98.3 per cent sodium carbonate (equivalent to the "sodium carbonate crystals" specified in photographic formulae) the remaining 1.7 per cent being moisture only.

Thus it appears that this 1d. per lb. soda is sufficiently pure for photographic use, so long as it is fresh and quite free from powdery coating. The 1.7 per cent moisture may be taken into account if desired when weighing out, by multiplying the required weight of soda by $10 \div 98.3 = 1.02$, but this is really unnecessary, as this small difference in no way affects the resultant developer.

In order to satisfy myself completely that the commercial soda is not inferior to the more expensive soda I prepared two developers each similar to the other in every respect except the sodium carbonate, that in the one being commercial soda, and that in the other the more expensive soda such as is sold by photographic firms. Two similar pieces of bromide paper were then exposed for equal times behind the same negative and developed, one in each developer, for the same length of time. Trial prints were obtained which were quite indistinguishable one from the other.—Yours, etc.,

R. KRESSMAN (Analytical Chemist.)

TANK LOADING.

SIR,—Under the heading "Miniature Matters" in a recent issue a question was asked about loading a tank. As I met difficulty in loading my "Simplex" tank it might perhaps be of use to "H. C. D." to state that my problem was solved by bending the metal cassette so as to ease the grip on the spool. It is not necessary to have a tight fit.—Yours, etc.,

J. B. W.

CAMERA SHAKE. GRAIN.

SIR,—First I should like to point out that camera shake does not increase in proportion to the size of image (see "Long-Focus Lenses," by Harold Burdakin, "A.P.," June 30th) except when using the lens, at a distance from the object, of the order of the focal length of the lens. However, it is obvious from the design of such lenses that they will be more easily shaken.

I should also like to point out that the microscope is practically useless as a guide to graininess. For instance, Panatomic and Super X developed in the same developer and viewed simultaneously under a microscope, appear almost identical. But on enlargement the difference is striking.

The film companies would hardly use a borax type developer if there were no advantages. It does decrease grain, although bromided M.Q. will also, if fairly dilute. But then there is a definite loss of film speed.

Paraphenylene-diamine developers without metol decrease grain a great deal, but the results are disappointing. I can recommend Panatomic with a borax developer.—Yours, etc.,

ROY MARKHAM.

Exhibitions and Competitions

CURRENT AND FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, July 31. Rules in the issue of June 30.

The Amateur Photographer Novices' Competition.—Special prizes of supplies of films. Latest date for entries, September 30. Particulars in this issue.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of The Amateur Photographer. Full particulars in advertisement page in this issue.

Nuro Competitions.—Cash prizes every month. Special prizes for boys and girls under sixteen. Full particulars obtainable from any photographic dealer, or from Nuro Ltd., Biggleswade, Bedfordshire.

Isle of Man Sixth Annual Amateur Photographic Competition, £300 cash prizes. Open until September 30. (P. A. Clague, Publicity Department, Isle of Man.)

Polytechnic School of Photography, 309, Regent Street, London, W.1. Exhibition of Students' Work. Open, July 13-16, from 10 a.m. to 8 p.m.; July 17, 1 p.m. to 9 p.m.

XVIIe Salon International de Photographie de Belgique.—Open, May-October. (M. Julien Lejeune, 70, Av. Van Becelaere, Boitsfort, Brussels.)

Lancaster Art Gallery. Open Photographic Exhibition.—Open, July 10-24. (G. M. Bland, F.S.A. Curator, Public Library, Market Square, Lancaster.)

Northern Photographic International and Open Exhibition, 1937.—Open, June 19-August 21. (W. Whitehead, 8, Bullroyd Drive, Bradford.)

Eighth Chicago International Salon of Photography.—Open, July 15-September 19. (Alex. J. Krupy, Chicago Camera Club, 137, North Wabash Avenue, Chicago, Illinois, U.S.A.)

XXXIIe Salon International d'Art Photographique de Paris.—Open, October 2-17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris (9e).)

I International Exhibition of The Photo-Press and Literature (Jugoslavia).—Entries, July 20; open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Jugoslavia.)

Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Entries, July 30; open, September 11-October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)

46th Toronto Salon of Photography.—Entries, July 31; open, August 27-September 11. (W. H. Hammond, 2, Gould Street, Toronto, Canada.)

3e Internationale Focus Fotosalon, Amsterdam, Holland.—Entries, July 31; open, September 11-26. (Focus, Ltd., Fotosalon, Bloemendaal, Holland.)

London Salon of Photography.—Entries, September

1; open, September 11-October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

Anthraxite Salon of Photography, Everhart Museum, Scranton, Penna, U.S.A.—Entries, September 7; open, September 18-October 4. (Salon Director, Everhart Museum, Scranton, Penna, U.S.A.)

International Photographic Exhibition, Budapest.—Entries, September 20; open, October. (Modern Magyar Fényképezők, VIII, Rákóczi-ut 19, Budapest, Hungary.)

Fourth Canadian International Salon of Photographic Art.—Entries before September 10; open, October 23-November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Sixth Irish Salon of Photography.—Entries, September 25; open, October 30-November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

"Irish Travel" Photographic Competition, 1937. Cash prizes.—Entries, September 30. (The General Manager (Photo Competition), Irish Tourist Association, 14, Upper O'Connell Street, Dublin, I.F.S.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Entries, October 1; open, October 29-November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Filters in Cinematography

By
NORMAN DYER.

CONSIDERING the advantages which follow from their use, the neglect of filters by amateurs can only be ascribed to an idea, which undoubtedly does exist amongst ordinary amateurs, that the use of filters is a difficult and abstract art. Such, however, is not the case, and it is the purpose of this article to show the effects of different filters and the occasions on which they should be used.

The Form to Use.

It is probably best to buy filters from the makers of the camera or lens used, as they are made to screw on to the front of the lens, thus facilitating easy interchange. The normal range is yellow-green in colour, and made in several different densities, which are classified by a figure indicating the amount of extra exposure required to compensate for the absorption by the filter, thus $2\times$, $4\times$, etc.

What a Filter Does.

The action of a filter is to impede, to a degree varying with the density, the passage of the blue rays, to which all emulsions are over-sensitive, thus allowing the other colours to record themselves, giving a proper tone rendering. The most obvious example of the necessity of this is when taking scenes with blue sky and white clouds, when, unless a filter is used to hold back the powerful blue rays, the clouds will not be recorded on the film. Another important fact about a filter, not so well known, is that it materially increases the contrast of a shot, giving an extra "sparkle" on the screen.

Coming now to the actual use of filters, it is important to note that the values of exposure increase given are for panchromatic material only, and a greater increase must be allowed for orthochromatic. The effect of a $2\times$ filter, necessitating "opening up" by one stop on pan. material and two stops on ortho., is to enable any clouds present in the scene to be faithfully recorded, and also, of course, to increase the contrast. For this reason it is advisable to keep a $2\times$ filter permanently on the camera, using it for all scenes except those in which there is already a considerable amount of contrast—brilliantly lit street scenes, for example.

Filter Factors.

The $3\times$ and $4\times$ filters, necessitating one and a half and two stops increase on pan. film respectively, give slight over-correction, making cloud forms stand out vividly against the sky, and

should be used when such an effect is desired. Due to the considerable increase in exposure required, such filters can rarely be used with orthochromatic film, and a $2\times$ filter is the only one really suitable for this type of material.

Another type of filter available is the orange or red filter. These cut out the blue rays entirely, thus giving a falsified rendering of tone values, sky and foliage being very dark, with clouds in heavy grey. For certain dramatic shots this effect is useful, but it is really rather outside the scope of ordinary amateur filming. A more useful property of this type of filter is that by under-exposing a shot taken in sunlight with the filter in position, a twilight effect is created, only the high-lights being clearly visible.

On the whole, therefore, it may be said that the useful filters for the amateur are the $2\times$ and $4\times$. The former should

be kept on the camera permanently, with the exception mentioned, while the latter should be used only when wide expanses of clouds are to be rendered.

Testing Effects.

The beginner who wisely decides to use filters for his work will not get very far if he sets about it blindly. He must learn exactly what difference a filter will make used for various subjects and conditions. This can be done only by comparison. He must take the opportunity of exposing a short section of film without a filter, and then continue straight away with a filter in position, making the necessary allowance in exposure. When this composite section of film is projected the change in the character of the picture will probably be a startling revelation and a good object lesson.

The Bridge Breakers. A good subject for the ciné amateur in search of a serial film showing the demolition of a bridge, followed by the building of a new one. The bridge shown is Wandsworth, now being broken up before replacement by a new structure.

How to Store Ciné Films Efficiently

By
"CINECAM."

THE well-known music-hall song, "Where do the flies go in Winter-time," sets us thinking of what becomes of our ciné films during the summer-time.

Of course, there are some amateur cinematographers who are as careful with their film storage as they are with everything else, but these are indeed very few in number. After all, we are only human, and the human tendency is to neglect unless the consequences are made obvious to us.

The great thrill is in the actual showing and viewing of the films that have been made. The future is completely forgotten in the excitement of the present, and when our eyes are eventually opened to our failings it is often too late. Then we can only repent, and decide to alter our ways.

Ciné films, unless they are specially prepared for storage, and afterwards carefully put away, will become utterly useless for further use. This being due

to the dirt that may have become lodged on the film playing havoc with the delicate surfaces by causing scratches, and other detrimental effects adverse to perfect projection.

All the above instances of damage can be averted by the exercise of a little care. This is negligible when compared with the future benefits that are to be derived. The secret lies in keeping to a definite method whereby nothing is left to chance.

The first step is to clean both surfaces of the film with a film-cleaning liquid, obtainable at any dealer. And this process is very much simplified if a rewinding stand is used. A smooth pad of cotton-wool, previously moistened with the cleaning liquid, is held between the fingers in such a manner that the film passes through the pad. Both surfaces of the film are thus cleaned simultaneously, and when the pad is removed it may come as a surprise when the amount of dirt that has been

removed during the process is observed. When all the films have been cleaned, all reels appertaining to the same subject should be collected together.

The individual reels must be placed into the special cans, which have humidifying arrangements and are obtainable from dealers. These cans are really an investment, and are well worth every penny asked for them. Films stored in them will keep in perfect condition. To prepare the cans for use it is only necessary to damp the contained pads with water, and they are then ready for instant use.

With their contained films, the cans may be stored in any convenient place, and if they are labelled, preferably with paint, any particular reel may be traced without trouble.

When labelling, the edges and the tops of the cans should be marked, and the several cans containing reels relating to the same title should also be numbered in consecutive figures.

Amateur Cinematography for Social Purposes

THE spread of cinematography as a hobby, combined with the increasing interest aroused by the "documentary" type of film, has led recently to the production of numerous non-professional films designed to serve some serious purpose. Charitable appeals, records of civic activity, records of customs and crafts which are in danger of extinction, and educational films, have been amongst the types successfully undertaken.

The production of such films frequently depends on collaboration between two sets of people—those who would like a film to be made and those who are willing to make it. Hitherto, contact between these two complementary interests has been a matter of chance. With a view to organising

such contact, the Royal Photographic Society and the British Film Institute have appointed an Amateur Documentary Film Panel, which will keep in touch with public service organisations on the one hand and amateur film-makers on the other.

The scheme will be worked in close association with the British Amateur Services Club recently founded by Mr. Robert Flaherty and Mr. John Grierson.

It is hoped that the existence of a body prepared to act as intermediary between those who provide the subject matter and those who produce the film will stimulate the production of films, which will in many cases serve some immediate purpose, and in all cases possess interest later on as historical

records. It is planned to circulate and preserve selected films through the medium of the National Film Library, which is associated with the British Film Institute. The co-operation of professional film interests has been secured and representatives from the Associated Realist Film Producers, the Association of Cine-Technicians, and the British Substandard Association have accepted invitations to sit on the panel, which will be known as the "Amateur Documentary Film Panel." Amateur workers or societies who wish to be included in the Panel's register should write to: The Secretary, The Amateur Documentary Film Panel, the British Film Institute, 4, Great Russell Street, London, W.C.1.

The Week's Meetings

Thursday, July 15th.

Bedford C.C. Ickleford.
Camberwell C.C. Secretary's Post Bag.
Hackney P.S. Outing to Kew.
Hampshire House P.S. "Print Gradation." J. Ainger Hall.

S. Suburban and Catford P.S. "Professional Adventures." A. F. Stevens.
Wimbledon Ciné C. Programme of Films.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

An Exhibition of unusual interest was opened on Wednesday last at the Camera Club, 17, John Street, Adelphi, W.C.2. It consists of oil paintings on a large scale, depicting wild animals in the jungles of India, Burma and Ceylon. The interest to our readers is that these pictures are based on photographs. They are by the artist, Mrs. Liane Morton, who has travelled extensively for the last ten years in pursuit of camera studies of wild life. Some of these pictures are from photographs taken by Mrs. Morton, and some are by Mr. Champion, whose flashlight pictures of animals in the jungles are well known. The pictures of fighting between lions and tigers are particularly realistic. The exhibition was opened by Lord Hailey, whose work in India entitled him to express an opinion of the pictures shown, and it was a very appreciative one. The exhibition remains open for six weeks and admission is free upon signing the visitors' book.

Readers of "The A.P." who are contemplating the purchase of a second-hand camera for their annual holiday, or some accessory for their present one, should write to Sands Hunter & Co., Ltd., 37, Bedford Street, Strand, W.C.2, for their latest catalogue of "Camera Bargains." In this booklet of 32 pages are listed a wide range of second-hand cameras of all types, from field cameras to miniatures. Ciné cameras and apparatus and stereoscopic cameras are also listed. In addition to cameras, enlargers, lenses and accessories occupy the last twelve pages of the catalogue, which will be sent free to any reader of "The A.P." upon application to the above address.

The latest winner of the Wallace Heaton Pictorial Competition is Mr. Thomas Haworth, The Brambles, Massetts Road, Horley, to whom the weekly award of 2rs. was made for his print entitled "All Together Boys." Full particulars of these weekly competitions for readers of "The A.P." appear regularly in our advertisement pages.

An Exhibition of photographs dealing with life in the Royal Navy was opened at the Ilford Galleries, 101, High Holborn, W.C.1, on Friday last, July 9th, by Vice-Admiral Sir William M. James, K.C.B., Deputy Chief of Naval Staff. The exhibition depicts various phases of life in the Royal Navy and will be of interest to many visitors. Admission is free.

The Nikor roll-film developing tank, which has for some time been popular in the United States, is now available to English workers. The entire tank is made of stainless steel, no other material, even in the smallest amount, entering into its construction. It consists of a

tank and lid, the latter being fitted with a light-trapped entrance through which the various solutions can be poured. The film is held in a reel, the ends of which are spirals of stout wire, a clip being used to hold the end of the film. The tank is easily loaded (in a darkened room) with the aid of the loading-guide provided, and can be used with safety for any photographic solution without danger of corrosion. It can even be used for physical development, any deposit of silver being removed with dilute nitric acid without harm to the tank. The Nikor tank is available for V.P. or $3\frac{1}{2} \times 2\frac{1}{4}$ films and there is a third model for 35-mm. film in 36-exposure lengths. In all sizes it uses 16 oz. of developer and costs 45s. The sole agents for this country are Messrs. R. F. Hunter Ltd., of Celfix House, 51, Gray's Inn Road, W.C.1.

In addition to the Nettar 515/DK recently reviewed in these pages, Messrs. Zeiss Ikon have brought out two other Nettar cameras taking 16 pictures each 4.5×6 cm. on a spool of $3\frac{1}{2} \times 2\frac{1}{4}$ film. These two models, known as Nettars 510 CD and 510 CT, both have an f/6.3 Nettar anastigmat, the shutters being respectively the Dervall, with speeds of $1/25$ th, $1/50$ th and $1/100$ th sec., and the Telma, which has speeds of $1/25$ th, $1/50$ th, $1/100$ th and $1/125$ th sec., with delayed-action for self-portraiture. With

the Dervall shutter, the camera costs £3 7s. 6d., and with the Telma £4. The 515/DK Nettar has an f/4.5 Nettar anastigmat in Klio fully-speeded delayed-action shutter with the release on the camera body, and costs £5 12s. 6d. These cameras can be obtained through any dealer, or from Messrs. Zeiss Ikon Ltd., Mortimer House, Mortimer Street, W.1.

A Second edition of the "Miniature Camera Guide, Reference and Record Pocket-Book," by William Alexander, has just been published. It concerns itself solely with the true miniature cameras taking 35-mm. film, and gives a brief review of each camera of this size. A chapter on accessories and one on Leica and Contax lenses is followed by a number of pages ruled to allow of entering full details of over 1,600 exposures, including filing references and enlarging data. These pages are so arranged that each 36-exposure film is allotted a full two-page opening. The remainder of the book, which is of a size and shape to fit the pocket, includes a large amount of useful information in tabular form. The "Miniature Camera Guide" is obtainable for 2s. 6d. from any bookseller or photographic dealer, or post free for 2s. 8d. from The Fountain Press, 19, Cursitor Street, E.C.4.

We learn with regret of the death of Mr. R. G. Hannington, President of the Swindon and North Wilts Field and Camera Club, who met with an accident while diving too steeply into five feet of water in a swimming pool and striking his head on the concrete floor.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5×3 , supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

83. Makers' Formulæ: Developers for Agfa Papers—(1)

Agfa 100. General Purpose M.Q.

Metol	9 grs.	(1 grm.)
Hydroquinone ..	26 grs.	(3 grm.)
Sodium sulphite (anhydrous) ..	115 grs.	(13 grm.)
Sodium carbonate (anhydrous) ..	230 grs.	(26 grm.)
Potassium bromide ..	9 grs.	(1 grm.)
Water to	20 oz.	(1,000 c.c.)

If using crystallised sulphite and potassium carbonate, take respectively 230 grs. (26 grm.) and 620 grs. (70 grm.).

This developer is used without dilution, but if a concentrated stock solution is preferred four times the quantity of each ingredient may be dissolved in the same amount of water, and the resulting solution diluted for use with three times its own bulk of water.

This developer gives full black tones on gaslight, Lupe, Brovira, and Portriga warm-tone paper. Develop Brovira for $1\frac{1}{2}$ to 2 mins. at 65°; reducing this time to 60 secs. for the other papers mentioned.

Agfa 105. Metol Developer (Soft Working).

Metol	130 grs.	(15 grm.)
Sodium sulphite (anhydrous) ..	660 grs.	(75 grm.)
Potassium carbonate ..	660 grs.	(75 grm.)
Potassium bromide ..	18 grs.	(2 grm.)
Water	20 oz.	(1,000 c.c.)

If using crystallised sulphite, take double above quantity.

For use, dilute with 4 to 5 times its bulk of water.

This developer gives full black tones on gaslight, Lupe, and Brovira paper, but should only be used when the negative is very hard. Time of development $1\frac{1}{2}$ mins. at 65° for all papers.

By mixing this with Formula 100, in proportions varying from 1:3 to 3:1, the hardness or softness of the prints can be controlled over a wide range.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed to: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Uneven Exposure.

As you will see from the enclosed strip of film, some of my negatives are very much denser than others. But they were of course developed for the same time, so I do not quite see how some could get more development than others. Can you explain this uneven development? S. P. (Ireland.)

What you describe as uneven development is really that some of the subjects have been rather fully exposed, these giving the denser negatives. With a variety of different exposures and different subjects you must not expect all the negatives on a spool of film to look alike.

Black Developer.

I send a sample of M.Q. developer which I made up a day or so ago. It is quite a normal developer for bromide paper, as the enclosed formula shows, and yet it turned black within a few hours of mixing. Can you tell me why this should be? R. G. (North Wales.)

From your description of the way in which your developer behaves we strongly suspect that the sodium sulphite was not sulphite at all, but some other chemical, possibly sodium sulphate.

We ourselves have made up many gallons of M.Q. developer and have never met with your difficulty. Our procedure is as follows: First, about 1/10th of the total amount of sulphite is dissolved in the water, this being warmed to about 130° Fahr. As soon as the sulphite is dissolved, the metol, the rest of the sulphite, the hydroquinone and the carbonate are added in turn, making sure that each is completely dissolved before adding the next. Finally, the whole is made up to the required total bulk by the addition of extra water.

We would add that it is essential that the chemicals be dissolved in the order in which they are given in the above list. The bromide can be added at any stage.

If you follow these instructions and still find difficulty we can only assume that your chemicals must be faulty.

Enlarging Lens.

I have a vertical enlarger with a condenser of focal length 6½ in. It has no lens; could I, to save space, use a lens of focal length 5 in., or must I have one of the full 6½-in. focus to match the condenser? E. A. (Chingford.)

The chances are that a 5-in. lens will suit your purpose quite well in the circumstances you name, as we take it for granted that the light is adjustable. If any difficulty should arise, you would certainly be able to get even illumination by using an opal bulb or by inserting a diffuser between lamp and condenser.

A Prize-winner's Query.

Can a print which has won an award in the Beginners' Competition be entered in either of your other classes, or in other competitions? W. F. R. (Maidstone.)

There seems to be no reason why you should not send a print that has won an award in the Beginners' class to another competition in which the rules do not forbid it. Naturally, however, we should not ourselves make a second award to the same print if it reappeared in our Intermediate or Advanced Workers' Competition.

Slow Speeds and Focal-plane Shutters.

I am contemplating buying a focal-plane camera, but it has no speeds slower than 1/25th sec. Would it be possible to have a brake fitted to provide 1/10th, 1/5th, etc.? G. R. W. (Sale.)

It is the usual thing with focal-plane cameras to have no slower speed than about 1/25th of a second, except in the case of certain miniature cameras. The fitting of a brake would at best be expensive, and might very easily be impossible. Messrs. Thornton-Pickard make a "time-valve" for slow speeds, and this has to be used in conjunction with a pneumatic release. You could find out from them whether this, if it attracts you, could be adapted to the camera you have in mind.

Frame Finder.

I have a camera fitted with a small frame finder, but I have to take such extreme care to get the subject centrally placed that the finder is almost useless for action pictures which call for speed in taking. Would you suggest that I try to get an optical direct-vision finder?

A. W. W. (Manchester.)

At least one expensive camera normally fitted with an optical direct-vision finder can be equipped by its makers with a frame finder for the express purpose of taking action pictures. And we agree with them that the direct finder is the best of all for this particular type of work. Unless your finder is wrongly adjusted in some way, we think that the reason for your non-success with it must be simply that you have not yet acquired the knack of using it, and we suggest that you indulge in a little practice in quick sighting and adjustment—with an empty camera, of course.

Convertible Lens.

I have a camera with f/6.3 lens, and the instructions state that the double extension can be used in conjunction with the back combination of the lens, presumably by unscrewing the front component. Will the half-lens give as good definition as the whole lens? Shall I need to stop it down, and, if so, to what extent? Can I use a filter with part of the lens only? R. L. T. (London.)

If you unscrew the front lens the back lens alone will have a different focal length, possibly something like double that of the complete lens. This will give you a larger image, but it will alter the value of the stop, so that f/6.3 may become f/12.6, and so will require four times the exposure. Whether it is necessary to stop down, and, if so, how far, depends upon circumstances, and you must judge this for yourself by the appearance of the image on the focussing screen. You can use a filter with the single component just as well as with the complete lens.

The Glass Side.

I have considerable trouble in getting the glass side of my plates clean. In spite of having wiped it when wet, I often find later what appear to be dried drops of emulsion, and attempts to remove them result in smearing the whole glass. Recently I tried "Windolene," and found it instantly effective. Is it likely to harm the negatives in any way? C. B. L. (West Byfleet.)

You seem to be getting quite unusual trouble with the glass side of your negatives. If this side is rubbed with a cloth before putting the negative to dry there should be very little left to polish off afterwards, and we ourselves find that a little breathing and rubbing will polish the glass perfectly. The preparation you have, however, should be quite harmless in the circumstances.

Pinacryptol Green.

In a recent issue of "The A.P." pinacryptol green was mentioned as a desensitiser. I have tried dozens of shops to get it, but without success. Can you tell me where I can obtain it, and at what price? F. D. H. (Streatham.)

Messrs. Agfa Photo, Ltd., 1/4, Lawrence Street, High Street, W.C.2, supply pinacryptol green in a quantity of 1 gramme, and any dealer can get this for you. A gramme costs 4s., and will desensitise an extremely large number of plates or films.

Trust your DEVELOPING & PRINTING to the specialists

Post your exposed films to Will R. Rose; specialists in all branches of developing and printing. Your negatives will be developed with the greatest care—only fine developers are used, and a new special paper will be used for your prints—you'll be amazed at its brilliance. Every single print has to be passed before it is sent to you.

HOW TO SEND YOUR FILMS

Wrap your spools securely (envelopes are not safe)—remember to enclose your name and address. Prices standard throughout.

PRACTICAL HINTS

Soft light on the subject makes a better snapshot.

MAGNA PRINTS (regd.)

Unless otherwise ordered, negatives V.P.K. and No. 2 Brownie size are printed the "Magna" way—magnified to $4\frac{1}{2} \times 3\frac{1}{2}$, and cost only $2\frac{1}{2}$ d. each. Magna Prints from miniature camera negatives are the standard price of 3d. each.

THE London Salon of Photography 1937.

SENDING-IN DAY, Wednesday, September 1st.

THE TWENTY-EIGHTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at The Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 11th September, to 9th October, 1937.

CONDITIONS OF ENTRY (Please read carefully).

1. Pictures must not be framed; but may be mounted or unmounted. Each picture must bear on the back clearly written (a) name of artist; (b) number and title of picture, corresponding to particulars on the Entry Form.
 2. When mounts are used they should conform to the following sizes— 25×20 , 20×16 , or 15×12 ; but no mount to exceed 25×20 ; and it is suggested that white or light-toned mounts be employed. Prints may be of any shape or size, provided they do not exceed the limits of the mounts as given above.
 3. All packages of exhibits from abroad must be clearly marked on the outside: "PHOTOGRAPHS FOR EXHIBITION ONLY—No COMMERCIAL VALUE—TO BE RETURNED TO SENDER." *No prices to be marked on the prints.*
 4. Pictures sent unmounted will be suitably mounted by the Salon Committee and all accepted pictures will be shown under glass.
 5. Pictures must be sent by post or parcel post, packed flat and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.
 6. All pictures for the exhibition must arrive at the above address on or before Wednesday, September 1st. Entries may be delivered by hand at the Gallery on that date only.
 7. The Entry Form for pictures from abroad must be sent SEPARATELY by post, together with entry and packing fee of 5s. (this fee covers any number of pictures from one exhibitor). Exhibitors residing in the British Isles may enclose Entry Form and fees with their pictures.
 8. Pictures sent by post will be repacked in the original wrappings and returned, carriage paid, after the close of the Exhibition.
 9. As applications are made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify, in the space provided for the purpose below, whether they have objection to such permission being given. The copyright in all cases remains the property of the authors of the prints.
 10. The Committee assure intending exhibitors that the greatest care will be taken of all work submitted, but they do not accept any responsibility for loss or damage either during transit or at the Gallery.
- If pictures are sold a Commission of 15% is payable to the Salon.
The submission of pictures will be understood to imply acceptance of the above conditions.
Notification of acceptance of pictures will be sent out as soon as possible.
A Catalogue will be sent to each exhibitor.

Q. Readers of The Amateur Photographer & Cinematographer who are preparing work for this year's Salon may use this page as an ENTRY FORM.

SEE CONDITIONS.

Q. Intending Exhibitors who are unable to secure extra Entry Forms in time may prepare their own on plain paper provided the conditions of Entry are adhered to.

ENTRY FORM.

TO THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.

Sir,—I submit the undermentioned Photographs for the consideration of the Selection Committee, and I enclose Postal Order (or International Money Order) of the value of 5/- to cover Entrance Fee and the cost of return postage.

INVEST IN AN 8-mm. MOVIE FROM R. G. LEWIS (CINÉ)

Obviously, discriminating purchasers of equipment pertaining to their hobby at some time or other take into consideration the running costs. For many years the movie camera has been beyond the reach of most of us because of the high cost of film. With the introduction of the 8-mm. size this objection has been almost entirely overcome. The running costs of 8-mm. cinematography are more than 60 per cent lower than 16-mm. In the early days of the smaller and new size some doubt was cast by a number of people on the ability of such a size to produce good results, but our own recent investigation with ALL of the cameras available proved to us beyond doubt that very little difference exists in the quality of the two sizes. Therefore, we urge you to take up home movies immediately and proceed to obtain some of the fun of making animated pictures.

FILMO DOUBLE “8”

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

SHEFFIELD — One minute walk from Town Hall

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

Edwin Gorse

ENGLAND'S LEADING DEALERS FOR:—

1. "Easiest" Payment Terms.—Up to 24 monthly payments. No prying enquiries. Enquiries and payments privately conducted, mark envelope "Edwin Gorse" (Private).

2. Exchanges.—Fair dealing is our motto. Definite allowances. We don't advertise ridiculous price exchange. We give definitely best possible price and never "quibble" on receipt.

3. Expert Advice.—On any camera, miniature, enlarger, cinema, talkie, episcope or accessories. Experienced advice in your choice.

4. Any New Latest Camera on 7 Days' Approval.—Exchanged if desired after "personal" test.

In all, once you have an "Edwin Gorse deal" you will be a client for life. Tell your friends. We want your recommendation.

NEW— LIGHT TRIPOD, 60 in. HIGH

Just what you have wanted for years, our new light-weight "eye-level" metal tripod weighs only 16½ oz., yet extends any distance up to eye-level. Strong aluminium aeroplane alloy, 10-section telescopic flat "side-by-side" legs. Closed 10½ in., extended full 60 in.

These special tripods are not available at mass production brass rates, but fill the "perfect tripod" needs, for miniature or modern camera needs.

Post 35/- paid.

Seven days' trial against remittance willingly.

NEW— RANGE-FINDER S.S. DOLLY

Roll-film, plate, high-speed lens and many unique features making it one of the finest cameras obtainable this year. Takes 12 pictures 2½ × 2½ size, or 16 pictures on 3½ × 2½ roll film, also vest-pocket plate single pictures, as desired. This wonderful camera has also rewind device, and you can expose part of the film 2½ × 2½, rewind, and expose 16 pictures, or rewind and take one plate picture, without wasting all the film. Coupled range-finder precision focusing, Meyer f/2.9, D. action Compur. £16 16 0

EXCHANGES. HIRE PURCHASE.

SMETHURST "HIGH-LIGHT" AVO EXPOSURE METER

Sets a new accurate exposure reading in this latest photo-electric exposure meter. Latest new introduction.

Exchanges. £4 4 0 In Stock.

AMAZING VALUE !!

TAKES 12 OR 16 PICTURES
 ON STANDARD 3½×2½ FILM

FINEST MOROCCO
 LEATHER COVERING

Constructed of Metal—NOT Bakelite.

Everybody, including the Press critics who have seen and tested the new all-metal Vauxhall Minicam, are amazed at the value. This low price is only possible because of the fact that we, as sole distributors, import large numbers direct from the factory in Germany, and, in addition, we are content to sell at a small profit. If you purchase a Vauxhall Minicam you will be saving approximately 50 per cent against the price of its nearest competitor.

PRICES:

2½ square or V.P., f/2.9 anastigmat, Compur shutter..... £6:19:6
 (Or under our SELF-FINANCED Hire-Purchase Terms of 12 monthly payments of 12/3.)

Ditto, with Prontor II shutter.. £5:19:6
 (Or under our SELF-FINANCED Hire-Purchase Terms of 12 monthly payments of 10/6.)

Takes 12 pictures 2½ sq. OR 16 pictures 2½×1½ inches.

A PLEASANT SURPRISE !!

Your old camera is worth MORE than you think. Fill in the coupon below and PROVE IT. We guarantee the highest allowance in the trade.

POST THIS TO-DAY

I am interested in the VAUXHALL MINICAM and should be obliged if you will send me descriptive leaflet and quote, without any obligation on my part, your highest INTRODUCTION OFFER on my apparatus described below:—

My apparatus is (Make).....

Age and condition.....

Extras (if any).....

I propose to pay the Balance { By Hire Purchase. Please
 (Strike out words which do not apply.) By Cash. send order form.

"Praised be the art whose subtle power could stay
Yon cloud, and fix it in that glorious shape."

Wordsworth.

Just a few words, but they have lingered in our memory. What a power there is in photography if it is used with knowledge and thought. Ah! that's the point; the art is in the knowledge, not in the "Super" bargain spread over umpteen months at 1/4d. a minute, etc., etc. THAT doesn't mean much except that the firms offering the goods are afraid to state the real cost in one breath.

We suggest that it is far better to have a chat with us and buy a camera that you can really afford, together with a few carefully selected accessories—perhaps a book or two, and get down to making good photographs that may eventually find their places in exhibitions and competitions. We sell and exchange cameras and apparatus but GIVE something else. It may make a lot of difference to your photography.

When you want anything, from a film to a complete outfit, please call, write, or phone.

—Oh! of course we have "Super" bargains! Here is an outstanding example:—

Contaflex, used but absolutely perfect, f/2 Sonnar,
2 filters, lens hood, E.R. case. Complete outfit
cost £76, our price..... £45 0 0

IF A CAMERA IS WORTH BUYING, WE HAVE IT.
DEFERRED TERMS — ADD 5 PER CENT

BALDAX

Roll-film camera for 16
pictures, 1½ x 2½ in., on
standard 8-exposure 2½ x
3½ in. roll film.

Here is a pocketable camera. The precision mechanism and compact design combine to produce perfect pictures. Rapid in use: you just press a button and the camera front springs into position. All-metal body, leather covered, nickel fittings and direct-vision view-finder. Direct spring view-finder of two optical units enables quick finding of the picture. Pressure plate holds film in exact focal plane during the exposure. Struts of entirely new design assure a rigid grip upon the lens.

Fitted with
Vidnar f/4.5 Anastigmat, Vario shutter..... £4 7 6
Meyer Trioplan f/4.5, Promior II Delayed-action Shutter (1/175th
sec.)..... £6 2 6
Meyer Trioplan f/3.5, Compur Shutter (1/300th sec.)..... £7 12 6
Meyer Trioplan f/2.9, Delayed-action Compur Shutter (1/250th
sec.)..... £9 0 0

Obtainable at all dealers, or write for complete catalogue to:

WALL'S DICTIONARY OF PHOTOGRAPHY

AND REFERENCE BOOK FOR
THE AMATEUR AND PRO-
FESSIONAL PHOTOGRAPHER

Edited and largely re-written by
F. J. MORTIMER, Hon. F.R.P.S.

Fourteenth Edition Thoroughly Revised

A complete reference work for the practical photographic worker. It provides useful information in dictionary form on every phase of photography—technical, pictorial, scientific and general, and is in itself an explanatory index to all terms, formulæ, etc. All the latest photographic principles are incorporated in the present edition, which includes up-to-date information on all recent developments.

Tempoplex Exposure Meter

Provides instantaneously the correct exposure time for any light condition, for films or plates of 17° to 32° Scheiner, or lens apertures from f/1 to f/45, for speeds from 1/1,000th sec to 30 minutes, based on the extinction photometer principle.

No calculations. Nothing to get out of order. Simplicity in operation. Small and compact, and can be carried comfortably in the waistcoat pocket.

[7896]

SITUATIONS VACANT

PUPIL required by high-class photographer.—Box 2645, c/o "The Amateur Photographer." [8280]

EYE-LEVEL VIEW-FINDER

The "Rhaco" View-finder has immense advantages over the ordinary direct-vision finder as usually fitted to hand cameras. A large, brilliant image may be seen, precisely as it will appear on the negative, when the camera is held at the eye-level position. Price 10s. 0d. (State make of camera when ordering.)

"RHACO" FINDER MAGNIFIER

The Rhaco View-finder Magnifier enables the user of any folding camera fitted with the usual small brilliant reflecting finder to see the image considerably magnified. It can be instantly clipped on to the finder of any small roll film or plate camera and focussed to suit the sight of the user. Model I, to fit on reflex finder ½ in. square or smaller—6s. 0d.

LENS HOOD AND FILTER HOLDER WITH FILTER

The "Rhaco" Combined Lens Hood and Filter Holder can be quickly attached to any ordinary lens mount. The Green Filter is unmounted and can easily be removed when not required, thus allowing of the lens hood being used without the filter.

PRICES

Model I, to fit lens hood ½ in. to 1 in. diameter, including Orthoplan Green Filter and leather case. 12s. 0d.
Model II, to fit lens hood 1 in. to 1½ in. diameter. 13s. 9d.
Model III, to fit lens hood 1½ in. to 2 in. diameter. 18s. 9d.

OBTAINABLE FROM ALL PHOTOGRAPHIC DEALERS

IKONTA

**f/3.8 TESSAR
COMPUR 1/400
ALBADA FINDER**

We have just purchased from Messrs. Zeiss Ikon a quantity of these cameras absolutely brand new, unused, and guaranteed by them, at a special price owing to introduction of camera body release, and no more will be available when our stock has been sold.

... A very fine popular size camera for any sports subject where a fast lens and high-speed shutter are required. ... Takes 8 pictures $3\frac{1}{4} \times 2\frac{1}{4}$ in., or 16 pictures $2\frac{1}{4} \times 1\frac{3}{4}$ in., and is safe for panchromatic film. ... F/3.8 Zeiss Tessar lens, Rapid Compur 1 sec. to 1/400th sec., with delayed-action (take yourself) release.

This delays shutter for about 12 seconds when desired. The Albada finder is particularly valuable when exposing at rapidly-moving objects. The exact amount of the subject being photographed is seen limited by a white rectangle which appears to be as far away as the objects being photographed. The field of view is large and clear and the image erect and unreversed ... 100 per cent self-erecting, always ready for the quick snapshot. A press on the opening button and the camera front is rigidly in the ready position. ... Two-point setting of iris and focussing scale, hinged back, rotating lens focussing. Size $1\frac{1}{8} \times 3\frac{1}{8} \times 6\frac{3}{8}$ in.

With f/2.8 Zeiss Tessar lens

£28 12 6 cash.

24 monthly payments of 25/4.

THE NEW ALL-BRITISH ENSIGN MULTEX II for only 7 1/2d. a day.

Takes 14 pictures 1 1/4 x 1 1/8 in. (3 x 4 cm.) on standard size 27 or 127 spool (V.P.).

The Ensign Multex is a precision miniature camera of unrivalled merit, possessing all the vital features necessary in such a camera without the disadvantages of extreme long length of film, necessitating a large number of exposures being made before developing and complicated and therefore slow reloading. Coupled range-finder. The range-finder is coupled to the lens and is very easy to use in dull or bright light, the two images clearly superimposing when the camera is correctly focussed. A particular feature is that the range-finder can be used down to a distance of 21 in., and is then exceedingly convenient for close-up scientific work on small objects, etc. Fitted with optical view-finder, automatic film wind, shutter speeded 1 to 1/100th sec. and Time, Ensign Multex anastigmat. £19 10 0

24 monthly payments of 17/8.

WHY YOU SHOULD CHANGE TO A MINICAMERA!

1. Our exchange allowances are unbeatable. A customer writes: "You allowed me twice as much as the highest offer I had elsewhere."
2. If our exchange allowance is as much as the first instalment due on our Easy Payment plan, then you take your new camera without paying out any cash.
3. Minicameras are handier for holidays, economical to run, and give superlative results.

FREE BOOKLET FOR MINIATURISTS.

& CINEMATOPHOTOGRAPHER

~ The Journal for Everybody with a Camera ~

SUMMER NUMBER

WEDNESDAY, JULY 21st 1937.

No. 2541. VOL. LXXXIV.

REC'D JUL 28 1937

This Rolleiflex Picture

shows what happy holiday shots the Rolleiflex camera will give you. Simplicity is the keynote of Rolleiflex photography. Simplicity in use—shows your picture full size, right way up, and what you see you get. Simplicity in film material—takes standard $3\frac{1}{2} \times 2\frac{1}{2}$ 8-exp. roll film, obtainable in any hamlet. Simplicity in development—negatives do not need special developers but can be developed simply and quickly at any photo finishers. With $f/3.5$ Zeiss Tessar lens and Compur Rapid shutter, speeded to $1/500$ th sec., T. and B., Rolleiflex costs only £25.

Free Photographic COMPETITION of great TOPICAL INTEREST

"SUNBATHING"

The holiday season will give you all the chances you need to get ideal pictures for this competition :—even if you are not going to the seaside, your local Lido will provide the material.

Remember—*sunbathing* is the subject—no diving or swimming pictures. Go out for your subject in the act of getting tanned—good photography will do the rest.

ANY AMATEUR MAY ENTER, USING ANY CAMERA OR MATERIALS

THESE ARE THE RULES.—The period of this competition is July 1st, 1937 to September 30th, 1937. Amateurs only are eligible. Write name and address, title of picture, and attach a Wallace Heaton Competition Coupon to the back of each entry. You can use any make of camera or materials and it is immaterial who develops, prints and enlarges your negatives. Entries may be any size, mounted or unmounted (not less than 8×6 unmounted is recommended). All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. No retouching, composite printing or faking allowed. Only simple spotting to remove pinholes, etc.

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.)

Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd. without further payment.

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made and no entries will be returned unless above is complied with.

A selection of the best entries will be held back at the close of the competition for exhibition in our galleries prior to their return.

Our gallery is *always* interesting—call and see it when in Town—Free, of course. Acceptance of these rules, etc., is a specific condition of entry.

£25 FIRST PRIZE

21/- WEEKLY PRIZE

J. H. Dallmeyer.

IN 1866 DALLMEYER MADE THE FIRST RECTILINEAR LENS

In 1937 Dallmeyer Lenses are fitted as standard equipment to most well-known makes of cameras, ciné cameras, and projectors. To-day, Dallmeyer Telephoto Lenses are acknowledged the finest in the world. Our reputation, gained by over 75 years' experience in the making of the finest lenses, is jealously maintained by the employment of skilled British workers, British raw materials, and British capital.

LENS MANUFACTURERS SINCE 1860

To-day Dallmeyer Lenses are used throughout the world. Testimonials from U.S.A., Canada, India, Australia, New Zealand, Ceylon, Burma, China, etc., etc., speak in praise of their tested superiority. The range covers every conceivable requirement of "still" and ciné photography.

F/5.6 DALLON TELEPHOTO

WIDE-ANGLE ANASTIGMAT

ANASTIGMAT LENSES

"PENTAC" F/2.9. Coma, spherical aberration, astigmatism, and colour have all been corrected in this unique lens. The short focal length Pentac is specially suited to 35-mm. ciné cameras, over 8 in. focus is ideal for portraiture. Prices from **£6 10 0**
"WIDE ANGLE" F/6.5 for focussing. F/11 for taking. The finest wide-angle anastigmat obtainable. From 2½ in. to 9 in. focus. Prices from **£5 5 0**
F/1.5 SPEED LENS for ciné cameras. Gives perfect definition. Freedom from astigmatism enables horizontal and vertical lines to be brought into focus simultaneously. Perfect correction for Colour enables it to be used for Kodachrome with 100% success. In focal lengths from 15 mm. to 3 in. Prices from **£10 0 0**

F/2.9 PENTAC ANASTIGMAT

WALLACE HEATON HAS THEM ALL GET YOURS NOW for a FEW PENCE A DAY

THE NEW MODEL Ia ROLLEICORD COSTS ONLY 5d. A DAY

Takes 12 pictures $2\frac{1}{2} \times 2\frac{1}{4}$ in. on $3\frac{1}{2} \times 2\frac{1}{4}$ in. 8-exposure roll film for 1/-. Shows the picture FULL SIZE, right way up, up to and during exposure. Full provision for parallax compensation. Automatic film wind making overlapping of exposures impossible. Depth of focussing and focussing knob combined. F/4.5 Zeiss Triotar lens. Engraved exposure plate at back. One-lever Compur shutter speeded to 1/300th sec., T. and B. Great versatility with the addition of Rolleiflex accessories all of which it takes except the angle mirror. £12:10:0
24 monthly payments of 12/3.

Sydenham.

"I am very pleased indeed with the Rolleiflex you supplied me. It is a beautiful camera. The exchange allowance you granted on my old camera was also in excess of all other offers I had. Indeed, in one case it was more than double." C. P.

Wolverhampton.

"I received the Rolleicord on Saturday and must say I am delighted with it. I have given it a test this week-end under terrible weather conditions, and the results are simply wonderful." J. I.

ROLLEIFLEX COSTS ONLY 9d. A DAY

Rolleiflex won the Daily Herald first prizes, £2,500 in 1935 and £3,000 in 1936, definitely proof of its superiority. Fitted with Zeiss Tessar f/3.5 lens. Brilliant mirror reflex finder with which critical focussing is achieved and the picture is seen right way up and same size as print. Compur Rapid shutter—from 1 sec. to 1/500th sec., T. and B. Automatic film winder, depth-of-focus scale, aperture and shutter readings show together in small window placed for easy viewing whilst composing and focussing your picture. Takes 12 pictures $2\frac{1}{2} \times 2\frac{1}{4}$ in. on $3\frac{1}{2} \times 2\frac{1}{4}$ in. roll film, or can be adapted for plates or 35-mm. miniature film, and a complete range of accessories make it really versatile. £25
24 monthly payments of 22/5

MODEL II ROLLEICORD COSTS ONLY 6d. A DAY

This popular camera won many big cash prizes—its operation is so simple. You don't have to bother with tiny view-finders, you see your picture full size and right way up. You see what you get—and get what you see. The great illuminating power of the separate finder lens makes critical focussing an easy and instant operation. You get 12 $2\frac{1}{2} \times 2\frac{1}{4}$ in. pictures on $3\frac{1}{2} \times 2\frac{1}{4}$ in. roll film for 1/-. or with the necessary accessories, plates or 35-mm. cine film can be used. Numerous other accessories make it most versatile. Fitted with either of the available lenses, it is equal to the best photography, indoors or out, all the year round.
With Zeiss Triotar f/3.5 lens, Compur shutter....£16 10 0
Or with Zeiss Triotar f/4.5 lens£14 10 0
24 monthly payments of 14/10 or 13/..

Which will it be?

Brilliant photographs—or disappointments? You can make certain of securing perfect pictures every time! Use the AVO Exposure Meter—the simplest photo-electric meter on the market. It tells you at a quick glance the correct stop and shutter speed to use for the light prevailing at the actual moment of taking the photograph. No complicated scale. No matter whether the light is weak or deceptively strong, or whether it is rapidly changing, the AVO Exposure Meter gives direct indication of correct exposure with easy-to-read clearness.

A USER WRITES—

Hitchin, Herts. 28-2-37.

"The AVO Exposure Meter has been invaluable to me while doing trick film work under difficult conditions — light conditions varied tremendously; it was necessary to alter the lens aperture at every shot. I would never have achieved the results I did without having the AVO Exposure Meter as a constant guide." (Signed) E. S.

6 IMPORTANT FEATURES

- Simple method of exposure indication—unique for easy reading.
- Extremely sensitive, indicates exposures from 60 seconds to 1/2,000th second.
- Uninfluenced by extraneous light.
- Size only $2\frac{1}{2} \times 2\frac{1}{2} \times 1$ in.
- Can be held and operated in one hand.
- Universal; for still or cine cameras.

63/- Ever-ready Case, as illustrated, 5/-

From all good photographic stores.

Agfa Karat

MINIATURE CAMERA

TAKES 12 PICTURES
THIS SIZE
ON 35-mm. FILM

FOR THE BEGINNER IN MINIATURE PHOTOGRAPHY the AGFA KARAT is IDEAL

Here's a chance to start miniature photography for your holiday with a real miniature camera that costs only £5 5s. Here are the reasons why it is the ideal camera for the beginner. Loading is the simplest and easiest yet invented. You drop in the 12-exposure cassette, pull out sufficient film to engage the sprocket, clip down and close the camera. The film winds itself into the opposite cassette—and when the 12 exposures are made you just lift out the cassette and send it to us for development. With the Agfa Karat you soon see your results—it is an obvious advantage for a beginner not to have to wait until 36 pictures are exposed. You can't take double or blank exposures. Automatic counter tells you how many shots you have made. An optical view-finder shows you clearly what to take. An excellent f/6.3 lens gives sparkling definition and good depth of focus. A shutter with 1/25th, 1/50th, 1/100th and Time and Bulb simplifies exposure problems. Its small size and handy placing of controls for quick action are points which will enable the veriest beginner in miniature photography to come back from his holiday with a pocketful of first-class snaps. The "Miniature Camera Magazine" says, "There's nothing at all cheap about it and it looks, at first glance, to be in the £20 class." Yet it only costs £5 5s.

ROBOT

"THE CAMERA THAT THINKS FOR YOU"

and Why!

● Shoots sequence pictures with machine-gun speed.

● Film winds itself automatically.

● Shutter sets itself automatically.

● Film counter operates automatically.

● No double or overlapping exposures possible.

● Automatic "Zone" focussing gives needle-sharp definition and supersedes range-finders.

● Takes up to 50 exposures on standard 35-mm. film.

● Dual cassette loading permits removal of any part of film at any time for development.

● Camera opens in daylight for changing from "pan" to colour film at any moment.

● With motor wound, takes from one up to 24 exposures in quick succession or singly.

● Motor can be left permanently wound.

● Incorporates filter suitable for "pan" or "ortho" films.

● Exposure automatically compensated when using filter.

● Shutter gives "Time" and from 1 sec. to 1/500th sec.—and *all* intermediate speeds.

● Weighs 14 oz. Just heavy enough to be held comfortably without risk of movement.

● Overall size only $4\frac{1}{2} \times 2\frac{1}{2} \times 2$ in.

● Three view-finders in one, including "right-angle" for "candid" work.

● Daylight-loading spools available.

● Camera has stainless steel body, covered black morocco.

● Interchangeable lenses.

CHOOSE A *Voigtlander* — ahead in Design and Performance

VOIGTLANDER Cameras are made by craftsmen who understand the difficulties confronting the amateur photographer and who have the skill to solve them. This is the reason for Voigtlander popularity, and why the name is respected wherever good cameras are known.

All Voigtlander models incorporate exclusive refinements of design, and features which ensure excellent results from every exposure made.

Run through the specifications of the models illustrated; among them you will find a camera to suit your particular needs, and then ask your dealer for a demonstration.

It will be an education in modern camera design.

THE SUPERB

A miniature reflex incorporating "parallax compensation," which ensures that the picture on the screen is identical with that on the film at every distance, the screen, mirror and finder lens automatically operating in conjunction. All controls are visible from above, the shutter speeds being engraved in reverse to be seen in the prism attached to the shutter. For 12 pictures $2\frac{1}{4} \times 3\frac{1}{4}$ " square on standard 8-ex. $2\frac{1}{4} \times 3\frac{1}{4}$ " film.

With Voigtlander Heliar f/3.5 lens in Compur delayed-action shutter, **£19 2 6**.

With Voigtlander Skopar f/3.5 lens,

£17:12:6

THE BRILLIANT

Unique among inexpensive cameras for its large hooded view-finder, which shows you the picture crystal-clear and practically full size while you take it. Takes 12 exposures $2\frac{1}{4} \times 3\frac{1}{4}$ " square on standard 8-ex. $2\frac{1}{4} \times 3\frac{1}{4}$ " film. Four models. With Voigtlander Skopar f/4.5 lens in Compur shutter, **£5 15 0**; and with Compur-Rapid shutter, **£6 15 0**; f/6.3 model, 3-speed shutter, **£3 15 0**; and the f/7.7 2-speed shutter model at **45/-**

THE RANGE-FINDER BESSA

Makes accurate focussing merely a matter of glancing through the coupled range-finder and turning a wheel. With the unique Bessa trigger-release under baseboard the camera can be held rock-steady in both hands and the exposure made at eye-level. Interchangeable built-in light filter, mask for half-size pictures, depth-of-field scale, Compur-Rapid shutter and genuine Voigtlander f/3.5 anastigmat lens, it is priced at **£21, £18 15 0** and

£16:10:0

THE BESSA

Has the cleverest shutter-release ever invented. It is mounted under the baseboard, enabling the Bessa to be used at eye-level without risk of shakiness. The Bessa takes either 16 half-size or 8 full-size pictures using standard 8-ex. $2\frac{1}{4} \times 3\frac{1}{4}$ " film. Ten models ranging from the **£9 12 6** model, with f/3.5 Voigtlander Voigtar lens, to the f/7.7 model at **52/6**

● USE ILLUSTRA FILM FOR SPEED AND FINE GRAIN AND BESSAPAN FOR PANCHRO. WORK

THE NEW WELTINI

**with coupled range-finder
combined with view-finder**

Takes 36 exposures 24×36mm. on standard ciné film. Fitted with Compur Rapid Shutter. Body release. Automatic numbering and film stop. Focussing lever automatically returns to infinity. Chromium finish.

MAKE MONEY with your camera

Do you know that in the British Isles alone more than 6,000 newspapers, magazines, trade journals, and advertisers buy literally hundreds of thousands of photos every year—and are always on the look out for more?

Think what this can mean to you! These buyers of photographs are not biased—they'll purchase your pictures as readily as those from other free-lance workers. But they must have a certain quality—a "something" about them that makes them more interesting than the average snap. We can show you by the J.P.D. "Personalised" Method just how to get that quality—that "something" into your pictures. We show you that, and every other phase of camera-journalism from the taking, developing and printing to advice as to the requirements of newspapers, magazines, periodicals, photographic agencies, advertising companies and other commercial firms. Also we give guidance and collaboration in regard to photographic competitions.

PERMANENT MARKETING ADVICE AND SERVICE FOR YOUR PICTURES

We need hardly emphasise that in acquiring the knowledge necessary to produce PICTURES THAT SELL you greatly increase your pleasure in your hobby, for obviously photos with life and interest in them are a much greater reward for your trouble than mediocre results. The profitable income they can produce for you is an added extra incentive to learn the J.P.D. method!

SPARE OR FULL TIME

You can devote as much or as little time as you wish—you can work all the year round—there is as big a demand for photographs of winter scenes, etc., as for summer. (No special or expensive camera and other equipment is necessary.)

Are you interested? Of course you are! Well, it places you under no obligation to send for this intensely interesting FREE book, which gives full particulars of the J.P.D. Personalised Method.

**Fill in NOW and
post coupon for this
magnificent FREE
BOOK**

The success of our members can be gauged from the following extracts:—

"Journalistic photography is so fascinating as spare-time work that as soon as possible I intend to make it a full-time occupation."

"I have earned in the last two months £23 from pictures."

"One picture alone sold for five guineas."

"Your last cheque for two guineas is positive proof of the efficiency of your service."

"I never realised the vastness of the field, the greatness of the demand as opposed to the supply, and the further I proceed the more interesting and profitable it becomes."

"Your marketing and sales service are a great advantage, and so fair that the utmost confidence is felt."

MALLINSON'S FREE-LANCING SERVICES

HERE is a photograph taken by a Mallinson Member with a vest-pocket camera one October morning. It has no human interest, but has a strong foreground, and is excellently composed. The scene must have been photographed by thousands of amateurs on holiday in beautiful Richmond.

The photographer joined Mallinson's some years ago, and has always remained a member of the Continuation Course, and in constant touch with them. He has so far sold this picture 23 times, as follows: Yorks E. News, 10/6; Co-op News, 10/6; Yorkshire Post, 10/6; Cycling (2), 15/-; Austin Mag., 7/6; This England, 10/6; D. Mirror (4), 70/-; D. Sketch, 21/-; America, 17/6; Country Life (2), 21/-; Practical Motorist, 7/6; D. Express, 27/6; Motor Cycling, 10/6; Home Owner, 10/6; Advertising, 7/6; Yorkshire W. Post, 10/6; France, 7/6. Total so far, £13 15s. 6d.

It has also been accepted by Mr. Mallinson for a new book to be published jointly by his Members for their mutual benefit, and will probably thereby realise a few pounds more.

Write without delay for a Prospectus of these invaluable Services, which train you at your will for Free-Lancing, Competition work or Photographic Technique, or for all three if you wish. Order at the same time Mr. Mallinson's book, now in its 21st Thousand, "Free-Lance Journalism with a Camera," with over 80 photographs, post free, 3/11.

MALLINSON'S FREE-LANCING SERVICES
(Dept. A) 7, Rose Crescent, Cambridge.

AGAIN WE AID THE LEICA USER WITH A NEW FACILITY!

Wallace Heaton's SPECIAL LEICA ACCESSORY CASE

Have you ever tried taking photographs in a ploughed field, on the beach, or on an "island" in the middle of the main street. Very awkward, isn't it, when you have nowhere to put your spare lenses and accessories with safety? This new Wallace Heaton case solves the problem. Made in the form of an attache case which can be suspended in a tray-like manner in front of you. There you have ready to hand exposure meter, interchangeable lenses, filters, range-finders or whatever else you may require. The case is plush-lined and beautifully finished. Expensive equipment demands proper care—this case gives it and facilitates good photography.

This, and all accessories shown below are obtainable only at Wallace Heaton's.

WALLACE HEATON STEEL-TAPE AUTOMATIC POCKET (TRIPOD)

Designed on the flexible steel - rule principle, this ingenious tripod measures only $3 \times 1\frac{1}{2}$ in. closed and weighs but 12 oz. Extended it measures 42 in., is amazingly rigid and will support a weight of over 20 lb. without collapsing. **17s. 6d.**

ZODEL LENS HOOD JUST THE THING FOR PERFECT PICTURES AGAINST THE LIGHT

It enables you to get beautiful pictures even facing the sun or glitter of the silvery sea. You can't get these effects without a lens hood. The Zodel eliminates all reflections inside the camera. Easily fixed. Telescopic and folds flat for carrying. State diameter of lens when ordering. Amazing value. **Only 7s. 6d.**

NEW "W.H." MINIATURE NEGATIVE STORAGE FILE

Serves to store Leica and similar negatives in strips of six. Has provision for 36 contact prints with spaces for data records. Stores 20 complete films, with their prints. Loose-leaf principle. Stiff cover binding. **21s.**

WALLACE HEATON LTD

Weston Universal Meter Model 650 for still and cine cameras.

IT'S ONLY THIS PART YOU WANT TO TAKE

What is the use of a light measurement over the whole area—

THE WESTON METER

OVERCOMES THIS DIFFICULTY FOR YOU

Acceptance angle of 60°. That is Weston's answer to the difficulty. You see, your camera is fitted (most cameras are) with a lens the covering angle of which is 60°. To get a correct light measurement for your camera it is essential that the meter you use should have an acceptance angle which coincides with the angle of your camera lens. Great sensitivity in a meter may merely mean that the area of light measured is far greater than that needed by the camera. Weston measures the light scientifically and accurately. It accounts for the various makes and types of film, and while having a simple direct reading for the novice, it provides alternative readings for the experienced photographer. The Weston meter has therefore a dual permanence. 1.—Its Weston Photronic cell does not deteriorate or wear out. 2.—The meter caters for the beginner and expert alike.

For Leica users there is a special Leicameter. Either model 8/4 a month for 15 months, £5 19 0 cash. Pigskin Leather Case, 10/-.

With the Weston Universal Meter and Leicameter the angle of view is 60°. This means that, regardless of the distance you are from your subject, the area of view covered by the meter is equal to the distance between your camera and the subject.

Amateur Photographers New Fields to Conquer

with a CINÉ-KODAK EIGHT

However good a photographer you are there's a limit to your scope with a "still" camera. This year, why not set out to conquer new fields—Movies! Colour! Continuous action! Equipped with a Ciné-Kodak Eight and your knowledge of photography, all these are at your command. And the cost is surprisingly small.

ACTUALLY, ONLY 4d. A DAY

ON WALLACE HEATON'S EASY PAYMENTS

BUYS A CINÉ-KODAK EIGHT

And the ingenious system of making a 25-ft. roll of film give the same entertainment time on the screen as 100 ft. of 16-mm. means that film costs are divided by four.

Then there's the thrill of colour—brilliant, natural colours, entirely free from grain—as easy to film as black-and-white, no filters or gadgets necessary either on the camera or, later on, on the projector.

Why not send us your first monthly payment of 9/- now, and bring back from your holiday real sparkling, life-like movies?

SUMMER
NUMBER

SUMMER HOLIDAYS AND THE CAMERA

THE height of the summer season is again approaching and the August Bank Holiday in a fortnight's time will mean the start of the annual vacation for many thousands of our readers.

In this Summer Number of "The A.P." we have endeavoured to deal with what the amateur photographer will want to do with his camera when on holiday, the subjects he may take and how to make the most of his opportunities.

From past experience we know that among the vast

numbers of people who will be holiday-making next month a very large proportion indeed will carry a camera of some sort. Many will be new to its use; some may not yet have chosen one, and others are already well equipped, but all will want to take photographs.

For each of these classes the following pages will provide useful suggestions, and the new-comers can be assured that they will find this hobby as easy to master as it is fascinating to practise.

In the meantime we wish our readers "Good Hunting."

"THE A.P." EXPOSURE GUIDE

At the request of many readers we are again presenting the very successful exposure calculator that was given with our "Novices' Number" earlier in the year. If the simple instructions are followed correct exposures for a variety of subjects under many different conditions can be ascertained easily and quickly.

TO FIND WHAT EXPOSURE TO GIVE

FIRST find the film you are using in Table I, and note the number in heavy type at the head of the group in which you find it. Names in italics refer to 36-exposure films for miniature cameras only.

SECOND, add to this number, in succession, the appropriate number from Tables II or III, IV and V. (If using a filter, add in the number given for it in Table VII.)

THIRD, look up total so found in Table VI; opposite it is the exposure you should give.

EXAMPLE. Agfa Iso-rapid film "2." Time 10 a.m. May "2" (total now 4). Subject, a street scene "6" (total now 10). Light, weak sunlight "2" (total now 12). Stop, f/5.6 "6" (total now 18). No filter used. Opposite 18 in Table VI is 1/30th sec., which is the correct exposure. (If using, say, an Ilford Beta filter "3" the total becomes 21 and the exposure is 1/10th sec.)

The Camera on the Coast

Here are a few hints that will help the amateur to make better pictures while near the sea, and will possibly assist in the avoiding of some of those errors which the D. and P. firms who develop and print vast numbers of amateurs' holiday exposures tell us spoil hundreds of seaside snapshots each season. Our readers will note that these hints are mostly for the beginner.

LIGHT on the coast is very "actinic," owing to the great expanse of sea, sky and sand. For this reason only about one-third of the exposure is needed that would be required at the same hour and with apparently the same light inland.

This means that with the new ultra-fast films over-exposure is a very real danger, and has become recently a quite common cause of failure.

The greater light-power means three other things, however: (1) That instantaneous snaps can be secured on the shore in light that would be considered hopelessly dull inland; (2) Snaps can be taken very much later in the evening with success; (3) Slower films can be used with advantage. When it is considered that the ultra-fast 'chrome films only require 1/400th sec. at f/8 during the midday periods of July and August it will be understood why 1/25th sec. (which is the least many less expensive cameras will give) shows marked signs of over-exposure, even at an aperture of about f/14.

Material.

Owing to the great actinic value of shore light it is best *not* to load with the very fast films, "ordinaries" giving much better and brighter results. Fast 'chrome film is not to be recommended if the whole roll is to be used in bright midday sun. Panchromatic film gives the best idea of various colours, and should be used if sunsets are to be attempted. If used during the brighter hours of the day a colour filter should be fitted to the lens. This will "damp down" the speed of the film and give better tone quality to the pictures. With the more expensive cameras having larger lens-apertures, the yellow filter should be over the lens for practically every subject.

'Ware Sand and Spray.

The two enemies of a camera near the sea are sand and spray—particularly sand. One grain will jam a shutter or ruin an iris stop, and in the film gear will cause scorings that will spoil any film. To avoid getting sand in, form the habit at once of exercising just a little more care than would be necessary elsewhere.

Never place a camera down on

loose sand. If of a folding type open only a few moments before taking and close immediately afterwards. With a box camera it is a good idea to make a "cap" to fit the round opening in front, taking it out only when it is desired to make an exposure. A piece of cork or rubber correctly shaped does excellently for the purpose, and keeps out all blowing grains.

Get into the way of carrying a box or open camera with its back to the wind (if possible, of course), and continually examine inside cases for stray particles of sand.

Form a habit, too, of always "feeling" the quality of the shutter action when on shores. If there is any sense of "woolliness" examine for a jam. D. & P. finishers report that sand-jammed shutters are a frequent cause of spoiled rolls.

Spray can be easier guarded against. Any drops that get on a camera should be wiped away at once as the salt soon sets up rust. Some photographers slightly grease exposed metal parts when using the camera where there is a danger of spray, as when taking waves on a rough day or photographing from a fast-moving boat.

General Hints on Taking.

Avoid too many groups if you want your final set to be successful. Let your subjects always be doing *something*. Despite the popular idea do not have your back exactly to the sun, but let the light source be to the rear *and to one side*. This gives relief to the various items in the picture.

The horizon will often appear in your pictures, but do *not* let it cut the picture midway. Have it in the upper or lower half according to whether the sky or foreground is most important. Above all *keep the horizon level*. This, of course, is done by the simple method of keeping the camera level. Watch the skyline in the finder for this purpose.

Distant Scenes.

Snaps of distant headlands, etc., are often disappointingly hazy, although near things are quite bright; this is because far objects need less exposure again than near objects, and as with the bright sea light are really badly over-exposed. Indeed, the best method of getting distant scenes is to

stop right down or give a very short exposure. A headland a mile away only needs *half* the exposure of people taken at the same time on the beach near-by. The use of a colour filter on the lens, used in conjunction with a 'chrome or panchromatic film, will give a much brighter rendering of distant objects at sea.

Silhouettes and Sunsets.

These are two popular subjects, and a set of holiday pictures should always contain one or two. By silhouettes we mean someone or something taken against an evening sky. Some very fine effects can be got this way. Place your subject so that the direct rays of the sun are shielded from the camera, and give a short exposure. The film will, of course, be under-exposed, but do not judge till you have seen a print.

For sunset effects use panchromatic films, as these differentiate between various shades of red. Choose evenings when there are strongly marked clouds, not just colour tones in the sky.

Other Subjects.

Readers will, of course, have their own ideas of what to take, but here are a few suggestions. The "looking down" picture: this is always interesting, and is obtained by exposing from promenades, piers, etc., on to the beach scenes below.

Wave tracery makes rather a novel type of picture obtained by looking down from a pier on to receding waves. "Moonlight" seascapes can be obtained just as the sun is sinking. Point straight at the horizon with the sun setting and print the final result deeply.

An occasional crowded beach scene should be taken. If sharp, very attractive arrangements can often be enlarged up from small sections showing the members of the crowd enjoying themselves.

Be always on the look-out for prize pictures. Many a good prize print has come from a batch of shore snaps.

Finally, owing to the amount of side glare near the sea, all seaside snaps are better if taken with a lens hood fitted. This will help to keep the image bright and clear. H. A. R.

PADDLING HER OWN CANOE. How much better is this back view and its suggestion of action than the ordinary broadside snapshot.

EVERY year hundreds of thousands of snapshots are taken by amateurs, and a very large proportion of them are of members of the family at the seaside or in the country. They are quite recognisable, they may be very good technically, and they undoubtedly make a personal appeal to the individuals concerned—but how boring they are to everyone else on whom they are inflicted at intervals during the ensuing twelve months.

Why not make your snapshots more interesting this year? Include the members of your family by all means—but not as dummies staring at the camera. Take them doing something, and let the surroundings help to make a real picture. Let the picture tell a story, and let the story be one that will interest everyone who sees it later.

There is no doubt that the snapshot

SURF BATHING. A good snapshot full of action that is an improvement on the usual splashing bathing picture with the figures all in a row.

AN ARGUMENT WITH MOTHER. A more interesting treatment than usual of a familiar seaside group; one that tells a story.

Make your more INTEREST

Some suggestions for the amateur photographer on holiday for improving the standard of his work with the camera.

that attracts most attention, and makes the greatest appeal to the largest number, is the one that contains what is called "human interest." Every landscape or view of the seashore, no matter how perfect it may be as a composition, gains an additional "punch" when figures are included. They must, however, be the right kind of figures, or figures doing the right kind of thing in that particular setting.

It is a fact also, particularly with holiday snapshots, that as the figures which are included in a snapshot gain in importance, that is, become more the centre of interest and are rendered on a

bigger scale, the more appeal the photograph will have for the person who sees it for the first time. This is assuming, of course, that they are not merely Aunt Emma and little Ernie sitting up straight and staring at the camera.

When, however, the figures in such snapshots are on so big a scale that they can be treated as portraits or "close-ups" different treatment is necessary, and the surroundings have less effect on the composition; the personality of the sitter then makes or mars the picture.

Take, for example, a picturesque seaside cottage, with an old country woman seated at her door. A straightforward snapshot of the cottage alone may make quite a charming picture, but it will be more or less in the nature of a record that may be successful pictorially according to the point of view chosen and the lighting effect.

Add the old woman at the door and human interest at once asserts itself. Provided that the old woman is not sitting like Aunt Emma and just staring at the camera, the general attractiveness of the picture is increased. She should be following some normal or characteristic occupation, such as knitting or peeling potatoes, or in any case be so engaged that her attitude is quite natural and non-camera-conscious.

Snapshots

ING

GOING ABOARD. Here the figures are caught in natural attitudes and the lighting and reflections make a striking effect.

BEACHY HEAD. This view without the figures would be just ordinary. The figures are doing something, and tell a story.

ing, and, provided she is a typical "ancient," complete with wrinkles, she may, with advantage, look at the camera on this occasion, as the idea is to produce a character study.

All three versions of this subject are, therefore, capable of being made interesting, but each will depend on the factors mentioned, any of which may be easily overlooked by the casual snapshotter.

On the sands, again, familiar figures of bathers and children, etc., should be subjected to a similar scrutiny, in order to obtain results that will render them less commonplace than the usual hurried snapshot.

The people concerned should, above all, not appear to be aware of the photo-

IN THE LAKE DISTRICT. The addition of the three hikers add the human touch that turns a "picture postcard" view into an attractive composition.

If a close-up is taken of the old woman, the cottage fades into second place, or may not be noticed at all. The attention is now concentrated on the face and the light-

grapher. In fact, back views are sometimes even more attractive than figures facing the camera.

If other figures, etc., in the distance make awkward patches behind those that are being "snapped," the quickest way is to move either to the right or left until the correct effect is secured.

Above all, try to make every snapshot of general interest by endeavouring to let it illustrate some incident or performance on the part of the people included, rather than being just records of the figures doing nothing—otherwise the result may also be nothing.

THE HARBOUR WALL. This snapshot is "made" by the inclusion of the human interest. Back views were all that were needed to make the picture.

Readers' Hints, Tips and Gadgets

HARNESS FOR TWIN-LENS REFLEX.

CAMERAS of the twin lens reflex type have an unfortunate habit, when worn in the "taking" position, of hitting the wearer under the chin if he makes an active movement, or of hanging forward and consequently running a risk of damage if the wearer is bending forward to do any climbing.

The writer has overcome this difficulty by having a small thumbscrew made which fits into the camera stand socket and to which is attached a buttonhole for fastening to the waistcoat. If this garment is not being worn, a cord can be attached to the thumbscrew and passed round the waist, as was done with the box respirator.

The device is useful too as an aid to steadying the camera. When using the magnifier for focussing it is more convenient to brace the camera up from the waist than down from the neck.

The illustration shows the arrangement worn over the white waistcoat of a tropical suit.

T. H. G.

A SIMPLE LENS-HOOD.

PROCURE a few inches of garden hose from the nearest ironmonger. The diameter should be $\frac{1}{8}$ or $\frac{1}{4}$ in. less than the diameter of the lens mount, and the cost will be 1d. or 2d.

Now cut from it a piece, square at each end, and of a length which will not obscure the corners of the negative when fitted on lens mount. If too long it can be easily pared down afterwards, so it is better to err on the long side and judge by trial (with a small aperture).

Cut the piece longitudinally so that it can be opened to fit over the lens mount. It will stick on quite firmly by its own springiness.

The black variety of hose is the best, the inside being matt black, and, of course, being rubber there is no fear of abrading any part of the lens or mount, and it is very light in weight.

J. NAYSMITH.

DIFFUSION FILTERS.

WHILST the exact rendering of detail is one of the virtues of photography, diffused effects are at times more appropriate to the subject, in portraiture and in subjects where the play of light is the theme of the picture and the exact rendering of detail might spoil the effect.

There are several ways of producing this soft effect—a diffuser in the enlarger (this does not produce the most pleasing effect, as the result is a spread of the darks whereas what we require is a spread of the high-lights), a special soft-focus lens is another method but is not of much use to the average amateur. The most satisfactory method is that of fixing a special diffusion filter over the camera lens. But if this is not obtainable here is a way to make a set of diffusers for a few pence.

Take a rejected film negative, remove all the emulsion (remember that both sides are coated), see that it is perfectly clean and clear, and then, with a needle, scratch a series of fine lines at equal intervals all over a piece large enough to cover the lens. Scratch a similar series at right angles, thus producing a square mesh. Here lies the virtue of this method, for a whole series can be made, varying from, say, 6 or 7 lines to an inch to 12 or 15, so that experiments can be made to find the one most suitable for your requirements.

These filters should be mounted in cardboard holders in a similar manner to gelatine colour filters.

H. JACKSON.

Why an ENSIGN MIDGET is an essential part of every amateur's holiday equipment

Because of its minute size and its photographic qualities, the MIDGET fulfils a range of purposes no other camera in the world can fill. You can consider it as your only camera—or you can use it on those occasions when you could not possibly have the ordinary camera available.

For this is the unique quality of the MIDGET—it can rest in handbag or pocket, so light, so small, as to become part of everyday wear. Yet it can be ready at a moment's notice, to take the photograph that comes upon you unexpectedly.

For it goes without saying that the unique picture opportunities that occur on holidays frequently remain only as dreams in the photo-

grapher's memory. The MIDGET changes all this by its sheer utility.

NOT A TOY—A PRECISION CAMERA.

The Ensign "Midget" is, of course, not a toy, but a perfect little camera. Fitted with lenses which give irreproachable definition and results pleasing in their quality, and so remarkable in definition that they enlarge easily to 12×10 in. or larger.

INEXPENSIVE FILM.—The film only costs 6d. for 6 exposures and, therefore, with the Ensign "Midget," "running costs" are lower per exposure than with any other camera.

All Ensign "Midget" cameras take pictures $1\frac{5}{8} \times 1\frac{1}{4}$ in. (3×4 cm.) size, and the camera measures only $3\frac{1}{2} \times \frac{5}{8} \times 1\frac{3}{4}$ in.

Model 33

Model 55

MODEL "33" with ALL-DISTANCE LENS in 3-speed shutter.

Gives wonderful depth of focus and enables sharp pictures to be secured without focussing from 4 ft. upwards. Large stop for normal exposures, small for brilliant light. 3-speed shutter gives $1/25$ th, $1/50$ th, $1/100$ th of a sec., Time and Bulb. Collapsible eye-level and waist-level view-finders. In leather slip case.....33/-

MODEL "55" with ENSAR f/6.3 Anastigmat in 3-speed shutter.

This model is similar in design and construction to the Model "33," but is fitted with the famous Ensar Anastigmat f/6.3. A first-class anastigmat of adequate aperture for all purposes, focussing down to 3 ft., fully corrected and giving pin-point definition over the whole field. In leather slip case.....55/-

COLOUR FILTER complete with mount 2x—
for Model 55 only7/6
TRAVELLER OUTFIT. Model "55" in case for 4 films and including colour filter in mount, 65/-

Have you had your copy of "ACHIEVEMENT," a remarkable gravure booklet showing a selection from thousands of wonderful ENSIGN MIDGET pictures? Just write the word "ACHIEVEMENT" on a postcard with your name and address and send it to—
ENSIGN LTD., HIGH HOLBORN, LONDON, W.C.1

Look for this sign in your dealer's window.

Do you know what this is?

The illustration shows the ultra-rapid Zeiss Tessar f/2.8 fitted to the Super Ikonta $2\frac{1}{4} \times 2\frac{1}{4}$ —the only roll-film camera of its size with such rapid optical equipment. The arm which rigidly holds the two rotating wedges of the built-in distance meter is also shown. It is the accuracy of this distance meter that enables the Zeiss Tessar f/2.8 to be used at full aperture with the certainty of needle-sharp pictures. The Super Ikonta illustrated takes 11 pictures $2\frac{1}{4} \times 2\frac{1}{4}$ on the usual $3\frac{1}{4} \times 2\frac{1}{4}$ spool.

The interlocking of film wind and shutter release prevents unintentional double exposures. The shutter release is on top of the camera body, and this model has also other features in common with "miniature" cameras. Other models of the Super Ikonta for $2\frac{1}{4} \times 1\frac{3}{4}$ and $3\frac{1}{4} \times 2\frac{1}{4}$ pictures, providing somewhat similar advantages, are also available.

SUPER IKONTA

Write for a copy of "Miniature camera advantages, with large-size pictures." It will tell you all about the Super Ikonta. Of course, the Super Ikonta carries the Zeiss Ikon written guarantee for three years. Ask your dealer for particulars.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

BOATS & HARBOURS

By SAMUEL
C. FOX.

Fig. 1. The Artist at Work.

IN all parts of the country the holiday-maker who chooses the sea rather than the country will find picturesque fishing villages and those small harbours that deal with odds and ends of local commerce. The southern coast of Cornwall, and indeed all the south-western seaboard, is particularly rich in seaport towns of this kind, all of which offer innumerable subjects for photography. There are boats, large and small, with the men working in and round them, the quayside itself, sometimes busy and sometimes momentarily deserted, but at all times with its forest of masts, and over all and everywhere the wheeling, screaming gulls.

Fig. 2. A Concourse of Gulls.

All these subjects change from day to day, and even from minute to minute. The larger boats come and go, so that each day sees a new arrangement of lines by the quayside, and the smaller boats move hither and thither all day on their various errands. Deserted one day, a small cargo vessel may have a group

of three or four men working on her the next, loading or unloading the hold or just doing odd jobs to paintwork or rigging. The continual change of grouping here provides opportunity for picture after picture, and the wise photographer will never pass by a harbour just because he was there two days before and "has taken all there is to take."

Not only do humans and

Fig. 3. Nets and Fish.

Fig. 5. A high viewpoint provides a simple background.

their activities change the scene, but there are natural forces at work, too. High tide and low give very different appearances to all these harbours, and, as in all subjects, the changing direction of the lighting as the day wears on may produce a picture in the afternoon where in the morning there was none.

For general views of a harbour as a whole, or for photographing inanimate objects, the advantages of the miniature camera are but little felt, save for the fact that for these small cameras film is cheap, and so

plentiful a supply can be carried without inconvenience that no subject need ever be missed. But as soon as people and their activities are chosen as a subject for picture-making the miniature comes into its own. Its inconspicuousness tends to prevent self-consciousness, and the great depth of focus it offers means that an evanescent grouping resulting from a sudden movement need never be lost through hesitation on the score of correct focussing.

My own equipment for holiday photography is a

Baldi 3×4 cm. camera with Compur and f/2.9 anastigmat, and a Dolly, with f/3.9 lens, which gives V.P. and 3×4 cm. sizes

Fig. 4. In Harbour at Looe.

Fig. 6. A Snapshot in Polperro Harbour.

at will. Using the mask in the latter camera, and carrying both, I can load up with ammunition enough for 32 exposures, and have the choice of the 2-in. lens in the Baldi or the 2½-in. lens of the Dolly for subjects requiring a narrower angle of view. These two together form, to my mind, the perfect holiday outfit, equipping me for subjects of all types in spite of the fact that both are real pocket cameras in size and weight.

Fig. 1, which shows an artist sketching the harbour at Polperro, gives an excellent idea of the surroundings of the harbours along this coast. Most are surrounded by wooded hills, with houses built at least part of the way up the slopes. The towns themselves are old, and built mostly of the grey Cornish stone.

Figs. 2 and 3 are typical harbour shots, the centre of interest lying in the one case in the men working on the

boat, and in the other in the ubiquitous gulls. Sometimes, especially in the more distant views, these gulls can be a nuisance to the photographer, making it impossible to produce a picture that is not dotted all over, in random fashion, with white spots that distract the eye and fail to fit into the composition. Patience is often needed to allow the gulls to go, or to group themselves in a pleasing formation.

In Fig. 4 the moored boats form little more than a pleasing background to show up the smaller boat in the foreground, which forms the centre of interest as much by its contrast with the dark mass behind as by the fact that it contains a figure.

Fig. 5 shows a simpler subject, and illustrates the use of water as a background. A high viewpoint, by separating the planes and excluding all distant objects, always makes for a simple and effective composition.

Choice of part only of a negative when making the final print is a method of improving composition and excluding

unwanted objects that is nearly as old as photography itself. Only the miniaturist, however, is in a position to make use of this powerful aid to picture-making in every print he produces, for he alone makes all his prints by enlargement. Figs. 6 and 7 illustrate, in a small way, the difference between the view included in the original negative and that really required to make the picture. Fig. 6 is no more than a reasonably pleasing snapshot; Fig. 7, made from the same negative, is much more nearly a picture.

Fig. 7. A much more pleasing composition, including part only of Fig. 6.

KEEPING EXPOSURES LEVEL

By G. K. SEAGER.

ON the average summer's day, or on any other day for the matter of that, there is seldom the necessity for using all the confusing variations in shutter speeds, lens apertures, and so on, of which a camera is capable. All the average user really wants is to be ready to take a photograph of anything that may strike his fancy, at any time during the day, with the minimum of essential adjustments to think about.

Between the brightest midday light and late afternoon it is not often that there is a greater total difference in average outdoor exposures than four times. During any one section of the

day any one change in conditions can be "taken care of" by halving or doubling the exposure. Those facts being admitted, one can commence operations with the useful all-round setting of the camera with a stop of $f/8$ and a shutter speed of $1/25$ th, or its equivalent.

Upon that basis one makes only a single adjustment at any one time, and each time by a "factor-of-two." There are three ways by which the "factor-of-two" can be applied instantly as required. The first is by opening or closing the lens stop by "one-place" or mark on the mount; the second is by changing the shutter-speed up or down, also by "one-place"; the third is to fit on or remove a "two-times" filter.

One can then decrease the exposure, one place at a time, by fitting the filter, or by closing the stop one mark, or by raising the shutter-speed one mark, for any (and every) one of the following events:—

At about 11 a.m.

If the sunshine gets really tropical.

If one goes on the open sea.

If one uses the very fastest film.

The effective exposure can be increased, one place at a time, by removing the filter, or by opening the stop one

mark, or by lowering the shutter-speed one mark for any (and every) one of the following events:—

At 2 p.m.

Again after tea.

If the bright weather turns noticeably dullish.

If it turns still duller.

For photographing a group of more than four people.

For any similarly near subject.

For any noticeably dark subject.

(N.B.—Two places for subjects which are both near and dark, or for any other combination of two of the above list of circumstances.)

From each stop-marking to the next, exposure is doubled or halved.

The average filter reduces the light to an extent about equal to halving the exposure.

Modern Miniature Cameras

AN INDEX OF REVIEWS.

THE weekly four-page section of "Miniature Notes" was first introduced at the beginning of last November, and has appeared every week, with one exception, since that date. Each week, on the first column of the third page of the section—the column which the reader is now scanning—there has appeared, under the heading "Modern Miniature Cameras" printed above, a detailed review of one of the many miniature cameras on the market.

These reviews, which are intended to be of assistance to the reader wishing to choose the camera most suited to his needs, have not been restricted to cameras introduced a week or so before the review appears, but have ranged over all the more interesting instruments available, irrespective of their date of introduction. Newly-introduced cameras, however, have been reviewed at the earliest convenient date, being allowed to take precedence in all cases of cameras that have been available for some time.

Taken together, these reviews, which in many cases give a great deal more information about the cameras than do the catalogues or other literature available, form a very valuable, if incomplete, directory to the apparatus at the disposal of the miniature camera user. Up to a point, memory serves very well to enable any desired review to be found, but now that over thirty have appeared it is probable that those interested would find an index to these reviews of value. Such an index, with the cameras classified according to picture-size, appears below.

INDEX OF REVIEWS.

November 4th, 1936 to July 14th, 1937.

Miniature Camera Gossip

By LANCELOT VINING.

A FRIEND in New York tells me that certain theatres in that city are now having photographic matinees to which photographers are invited to bring their cameras. On these occasions artistic lighting is dispensed with, and everything possible is done to help the cameraman. The shows selected are usually musical, with plenty of action.

I wonder what support would be given to one held in London, and if it would be possible to get one staged this winter? *Balalaika* at His Majesty's would be ideal, and either this show or the Palladium would offer plenty of variety.

Long Focus.

After my first tests with the new series F film, I felt sure that it would now be possible to use my 5½-in. lens in theatres, etc. This week I have been able to make my first serious tests, and the results proved that my belief had some foundation.

The illustration of Max Miller is enlarged from a very small portion of the negative, about a quarter of an inch square. The complete film

MAX MILLER AT THE PALLADIUM.

1/500th sec. at f/4, Agfa F film, D76 diluted.

includes slightly over three-quarters of his figure.

Holiday-makers Beware!

I have just returned from a few days at the sea, where I found that the brilliant light was rather disconcerting after the

THE HOLIDAY SPIRIT.

1/500th sec. at f/4, Agfa F film.

dimness of London and its theatres. I was very glad I had a meter to check-up with, and I was surprised at the readings it gave. Beware of your exposures when you are on holiday—and beware of your developing times, too. (More about this next week.)

And as a final warning, beware of your backgrounds. I found a crowded beach the most difficult place in the world to get good results. For the leaping picture reproduced here I thought I had a nearly clear beach, only to find on making the print that a black dog appears to be having a nibble at the girl's head.

Vanished.

I had no luck with my first flashlight exposures on the new F film; I decided to make a further cut of a minute in the development time, but the results were still quite unprintable. I was working against the clock, every minute counted, and I had a dinner date to keep. In my hurry I snatched up a bottle of reducer which is usually kept diluted. But this time it was not, and the result was that the image could not have vanished quicker had I been a conjurer.

I told W. L. F. W. my troubles and he advised 50 per cent dilution of the D76. I followed his advice, and my next batch were quite good.

With the diluted developer, I found ten minutes right.

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

Snapshot Portraiture of Babies

By C. D. CLARK.

Fig. 1. A Cheery Smile.

MY camera is a Baby Ikonta with f/3.5 Tessar lens, and I obtain a lot of fun and a great deal of pleasure in using it to take portraits of young children. This little camera appeals to me primarily because of its extreme portability. It is generally in my pocket when visiting friends with young families, and, if conditions are favourable, out it comes and several exposures are made.

With very young babies it is the fleeting expression which counts, and it must be waited for and the opportunity seized when it occurs. This is no trouble with a miniature, since, with shutter, aperture and focussing set, and one's eye glued to the view-finder, a series of sixteen exposures can quickly be "fired off" if good humour is predominant.

In this way a wide choice of negatives for subsequent enlarging is obtained.

Figure 1 shows an infant taken outdoors in sunshine. A back-lighting effect such as this is often pleasing in portraits of young children, but a lens hood must be used. Under these conditions 1/tooth of a second at f/5 was given, which allowed for stopping camera shake and movement while the aperture gave sufficient depth of focus even at the close range of 3 ft. The dark background was obtained by draping a black eiderdown over a child's easel.

It is sometimes preferable to have no arranged background and to photograph the child informally in its perambulator, as in Figure 2. No "studio" effect is obtained, but the surroundings match the subject and no incongruity is felt.

Great help can be given by a third party who is willing to make humorous noises or in some way hold the attention of the child while one is operating with the camera. He or she can also be of assistance with a flexible rule to check one's estimate of distance.

Fig. 2. "Who woke me?"

An Exhibition of Miniature Photography

AN exhibition of prints made from negatives taken with miniature cameras was recently opened at the Galleries of the Royal Photographic Society, at 35, Russell Square, W.C.1, the exhibitors being members of the Miniature Camera Group of the Society. The exhibition, which occupies two rooms, is of a high standard, and very varied in style, including subjects of all types from landscapes to theatre shots. One at least of these last is worthy to rank among the most successful and the most pictorial, of its kind.

An exhibit that attracts attention is the series of five prints in colour, made

by the tricolor Carbro process by enlargement from three separate negatives.

A notable feature of the exhibition as a whole is that the usual tendency of the miniature camera user to concern himself chiefly with extreme "close-up" is not very strongly in evidence. The suggestion is that the miniature camera is no longer restricted to specialised work, but is now being applied to subjects of every sort, from portraits to distant landscapes.

The exhibition, which no miniaturist should miss, remains open till July 30th. Admission is free.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

DUAL-SIZE ENLARGER.

Is it possible to obtain an enlarger capable of dealing with 35-mm. and also 3½ × 2½ negatives, giving an enlargement up to at least 12 × 10 in both cases?
S. S. (Birmingham.)

To enlarge a 24 × 36 mm. negative to 12 × 10 means an enlargement of 10 diameters. So far as we know there is no vertical enlarger on the market in the 3½ × 2½ size which will enlarge to so great a degree as this. To fulfil your requirements you will therefore need an enlarger which is fitted to take interchangeable lenses. We know of only two enlargers so fitted; one is the Leitz Varyl enlarger, which has manual focussing, and the other is the Exakt, in which focussing is semi-automatic. Either of these enlargers can be obtained through any dealer. Details of the Varyl can be had from E. Leitz Ltd., 20, Mortimer Street, W.1, and of the Exakt from R. F. Hunter, of 51, Gray's Inn Road, W.C.1.

U.V. FILTER.

I have a miniature camera, and with it I use either a yellow or a green filter. I am spending my holidays among mountains, and hope to get photographs at altitudes up to 10,000 feet. Ought I to buy a special U.V. filter for this work, or will my ordinary yellow filter do?
W. G. M. (Tunbridge Wells.)

Negatives taken at high altitudes with no filter are often slightly unsharp on account of the preponderance of ultra-violet light, for which the lens is often not completely corrected. If you wish to get negatives of the type normally obtained without a filter, and yet to have them sharp, you will need a U.V. filter, which cuts off the ultra-violet light without providing any noticeable colour-correction. But if you require the colours to be corrected to the extent to which you are accustomed when using your yellow filter, just use it; it will cut off the excess of ultra-violet light along with the visible blue, so doing the work of the U.V. filter as well as its own.

METHODS OF DEVELOPMENT.

I use 2½ × 3½ roll film, making 16 exposures on each spool. Can you tell me whether I shall get better results, on the average, by making use of dish development by the see-saw method or by using more diluted developer in a tank? L. M. (Manchester.)

We think you would do better to rely on a tank rather than on hand-development for your roll films. Our reason for this advice is simply that in a tank the film is completely protected from the scratches and other markings that can so easily arise when handling it in the dark-room. So far as photographic quality is concerned, there is nothing whatever to choose between the two methods.

POOR DEFINITION.

I enclose some negatives taken with a V.P. camera, and as you will see they are not nearly sharp enough for enlarging. Can you tell me what is wrong?
D. W. P. (Norwich.)

It is very evident from your photographs that the lens is not at the right distance from the film for giving a sharp image. We cannot guess, however, whether this is due to maladjustment of the camera or to your own incorrect use of it. If you can find a photographic friend of experience he will probably tell you at once what is wrong.

MONEY FROM A MINIATURE.

In a recent article "The Self-Supporting Miniature," suggestions were made for making money with a camera. In my case all work has to be done by a D. & P. firm; with this in mind, would you recommend me to try to sell photographs? And if so, what ought I to charge? N. B. (Bakham.)

Whether you can make money with your camera in the way outlined in the article you mention depends chiefly on your own commercial abilities, but you will find it necessary to show a prospective customer an enlargement and not a contact print. This, as you are having your enlargements made for you, will probably make a very big hole in your profits, as you may have to make a fair number of enlargements which you do not sell. As for scale of charges, we suggest that you find out those current in your own district among the professional photographers, and base your charges on that.

SUMMER LANDSCAPE.

By E. SCHNEIDER.

THE BATHING-POOL,

By M. RODRIGUE.

BATHING-POOL

By
A. APPLEBY.

Photography

high-speed worker with an ideal subject in securing diving shots. For pictorial purposes, groups of bathers or single figures occur in attractive poses at every

turn, and, provided no objection is made to the use of the camera, a few hours spent at a bathing-pool with a camera will ensure a good bag of pictures.

For the diving subjects, however, if a high degree of definition is to be obtained in the photograph, a camera with a very rapid shutter is absolutely essential. The use of fast panchromatic film will tend to speed matters up a little. A cable release will also be found very helpful as it avoids camera-shake to a certain extent. Take your position, wherever it suits your purpose, but preferably with a low viewpoint to get the divers against the sky, and practically follow them down through your direct-vision view-finder. (It is the best for this kind of work.)

Set your camera lens to the largest stop, and the shutter speed to the highest, then take your sight and

Ready — for — High Diving.

THE bathing season is now in full swing, and facilities for bathers of both sexes are becoming greater every year. In addition to the obvious opportunities for bathing at the seaside, bathing-pools are to be found in all parts of the country, and even at the seaside resorts these pools are a feature that permit safe bathing, swimming and diving at all states of the tide.

But no matter where they are situated, they offer wonderful possibilities for picture-making with the camera, and provide the

In the
Bathing-
Pool Fountain.

Down the Chute.

watch the divers take off. You will have noticed that at a particular point at the beginning of the dive the diver appears to be momentarily motionless, and it is in this fraction of a second that the picture should be taken. In this way good pictures can sometimes be obtained with a shutter speed of 1/100th part of a second. If the diver is allowed to fall before you expose your film a shutter speed of at least 1/400th part of a second will be necessary. Be sure to use your finder to take a vertical picture or you may miss the diver altogether.

Castle Combe, Wilts. Entrance to the village from the Bath road.

THE summer holiday-maker with a camera who does not spend all his time at the seaside will find material for many pictures among the beautiful villages that exist in all parts of the country.

Some counties are richer in old untouched villages than others, but in these days of road travel, either by car or coach, there is little difficulty in reaching any of them, and they will be found ideal subjects for the landscape photographer. The possibilities for picture-making are never exhausted in these localities, and there is always a new point of view to be found for the real artist who looks for it.

Castle Combe, in Wiltshire, is commonly recognised as one of the most charming villages in England. Its situation is particularly pleasing. Nestling in a well-watered valley, effective vistas between intervening trees are obtainable from the top of a hill opposite the church. From ground level vantage-points for general views are naturally much more numerous. These include treble-arched bridge, church, pretty cottages, and an interesting market cross, a survival of days when Castle Combe was a cloth trading centre.

Arlington Row, Bibury. These beautiful old cottages have been purchased by The National Trust.

Inland Beauty Spots

Picturesque Villages as subjects for the Summer Holiday-maker with a Camera.

By HAROLD GRAINGER.

Cottages at Cockington, Devon.

In the Cotswolds are many beautiful villages, each of which will provide endless pictures. The architecture of these parts is substantial and artistic—Tudor and Jacobean manor houses and farmsteads roofed with stone slabs. Cheltenham is an ideal centre for the exploration of so delectable a portion of rural England; its rail and bus facilities are both good. One really splendid day can be assured by taking an early bus to Stanton. The journey may be broken and resumed at two or three other villages; at Prestbury, for instance, at Southam Delabere, at Bishop's Cleeve, at Winchcomb, at Stanway, and finally Stanton. The last-named is a village well cared for

Leica

WITH
**XENON LENS F/1.5
RAPID WINDER**

This equipment is geared to the tempo of modern times. It enables the pressman to take snapshots of short, instantaneous exposures at night and indoors with machine gun rapidity. The Leica is the handiest and smartest of miniature cameras. Constantly fostering progress, it copes with every photographic need.

E. LEITZ (LONDON), 20, MORTIMER ST., LONDON, W.1.

THE NEW S.S. DOLLY

Have you ever handled a Super-Sport Dolly? Without the range-finder they are really superb cameras, and have long been the favourites of many discriminating miniaturists, but now that they have been fitted with coupled range-finders we can safely prophesy a great future for them. We incline more towards the Model C than to the A, since the capacity of the former to take plates as well as roll films, and its ability to use interchangeable lenses, appeals strongly to us, but for the worker who uses only roll film, and needs only a standard lens, the Model A is the ideal camera.

Prices range from £5 17 6 to £12 16 0 for the Model A, and from £9 9 0 to £16 12 6 for the Model C.

THE NEW ROLLEICORD 1a

Another Rolleicord Model, fitted f/4.5 Zeiss Triotar lens and Compur normal shutter, and the price is only £12 10 0. As usual, the makers have turned out a very fine camera!

It takes the usual 12 pictures 2½ in. square, has parallax compensation, and gives excellent screen illumination, with "right-way up" image showing the complete picture. It is covered in art leather, and, generally, represents very good value for money.

THE CONTAX

A very fine camera, this! Both range-finder and view-finder images are seen in the one viewing window and the general specification of the camera is an impressive one. Lenses range from 2.8 cm. to 50 cm. in focal length, and from f/1.5 in aperture. The shutter speeds run from ½ to 1/1,250th second, with delayed action, and a very full range of accessories for the amateur or professional is available. Prices from £31 for the Model I with f/3.5 Tessar to £78 5s. for the Model III with f/1.5 Sonnar.

48 Pictures—2 Shutter Winds

There is no camera on the present-day market against which the Robot can be compared. It definitely stands in a class of its own; no other camera is so rapid in action, and we have yet to meet a camera turning out better work. We should be delighted to demonstrate the camera, or to give any information regarding it!

Prices: With f/2.8 Tessar, £29 10 0
With f/3.5 Tessar, £26 10 0
With f/3.5 Primotar, £23 10 0

THE LEICA

Undoubtedly the handiest and lightest high precision coupled range-finder miniature ever produced, the Leica has many advantages over its competitors. Its lens equipment ranges from a focal length of 2.8 cm. to 20 cm., and the maximum aperture, available with the Xenon, is f/1.5. The shutter speeds go from 1 second to 1/1,000th, and a wonderful array of accessories is available for all models. Prices from £16 19s. for the Standard Leica with f/3.5 Elmar to £56 16s. 6d. for the Model 250 with f/2 Summar.

MOTHER AND FATHER!

One truly does feel about the Leica and Contax that they are the parents of all the miniatures now available! Their makers certainly have blazed a glorious trail, and whatever cameras may come and go, these cameras will ever be dear to the hearts of those who use them!

BRING THE GOOD OLD BUGLE, BOYS!

No, just for a change we're not going to blow our own trumpet—judging by the way our satisfied customers are doing that for us, there seems no need for us to do it in any case! This time we want to draw attention to the superlative qualities of the cameras shown above. Every one of these is a winner, but, of course, different cameras will appeal to different miniaturists. We are afraid that we have had to omit some old and well-tried friends, such, for instance, as the Exakta, Reflex-Korelle, Rolleiflex, Super Ikonta, Dollina, and a host of others, but space, in our case, is not infinite (*à la Einstein*) but very definitely limited, so we will just tug our forelocks in loving memory of temporarily absent friends. If you would very much like one of these cameras, why not turn in your present miniature in part exchange, and, if necessary, spread the balance payable over hire purchase. It is not blowing our own trumpet to say that you could not get better allowances and better service elsewhere; as specialists we ought to be able to offer you an unparalleled service, and, by gum, we do! "Try 202 for Service!"

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4780)

(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

alike by cottagers and owners of the Elizabethan and Jacobean manor houses. Another profitable day can be spent at Bourton-on-the-Water, the "Venice" of the Cotswolds, and one or two neighbouring villages.

Reached by bus from Cirencester, Bibury was described by William Morris as "surely the most beautiful village in England." Then in 1898 Leslie, by his Academy picture "Arlington Row," and Mr. Gibbs, the novelist, by his book "A Cotswold Village," raised it high in public favour, and perhaps nowhere is there a series of English cottages better known than this same Arlington Row, which, to make preservation effective, is now officially cared for.

Eardisland, in Herefordshire, has also won national renown. Featuring much good black-and-white domestic architecture, typical of the county, the immediate vicinity of the steep old bridge spanning the river Arrow is rich in pictorial possibilities.

Old Cottages at Stanton. A Cotswold beauty-spot.

Studland, near Swanage.

Amongst villages easily reached from Bournemouth, Swan Green, a hamlet near Lyndhurst, is perhaps chiefly interesting to pictorialists because of opportunities to include New Forest ponies in the foreground of views of its thatched cottages. Studland, across the Bay, is also worth a visit with its thatched cottages, which lend themselves to pictorial rendering.

Cockington has long been regarded as Devonshire's prettiest village, and in the Chilterns there is the same tale of beautiful old villages such as Bledlow and West Wycombe, which also has come under the care of The National Trust.

In Yorkshire, Cumberland and Norfolk numerous old villages can be found, and there are many such in Sussex and Hampshire, Dorset and Somerset.

It would, of course, be impossible to

Swan Green, near Lyndhurst, Hampshire, with New Forest ponies.

July 21st, 1937

ON A ROCKY COAST. *The end of a summer squall. 1/100th sec., f/11, Verichrome.*

NOW is the time when the amateur photographer with any kind of camera has the opportunity of making good pictures. During this time of year, particularly at the seaside, the chief problem is how to avoid over-exposure, and even the cheapest

WESTWARD. *A subject that calls for a small stop and fast shutter speed to avoid over-exposure.*

Summer with the

camera with the smallest stop will enable good fully-exposed photographs to be taken.

With this reserve of power in hand there is no reason why the veriest beginner cannot attempt to secure a few really good pictures, that will be more appreciated by his friends generally than the entirely personal snapshots that appeal only to himself and his relations.

NEARING SUNSET. *1/50th sec., f/11, Pan. film and light filter.*

For instance, he may be taking his holiday at that part of the coast where there is a certain number of sailing craft or yachts to be seen; these alone offer endless opportunities for good pictorial summer-time pictures. A snapshot of the sea, taken from the end of the pier, may appear to be an entirely uninteresting expanse of water, but when graced with the presence of a few sailing boats or racing yachts, the entire scene is changed, and a striking picture, that may even appear as the winner in a competition or an exhibition, may be secured.

Thrice fortunate is he who can get afloat in another yacht, or even in a power boat, that enables him to photograph these

Seascapes CAMERA

craft at close quarters, as then there is still greater opportunity of securing almost ready-made pictures. He can drive the shutter of his camera as hard as it will go and use the smallest stop and still obtain well-exposed negatives.

If, however, there are no boats or ships to break the straight monotony of the skyline, he can wait for a striking sunset effect, which will afford strong light and shade and turn the water into a mass of sparkle and broken tones which can be turned to good account,

THE RACE. Squally weather. $1/1500$ th sec., S.S. Pan. film, $f/11$.

While all these subjects are within the range of practically any type of snapshot camera, a lens hood is an accessory that should be used whenever possible. This will ensure brighter negatives and counter the glare from both sea and sky. A direct-vision finder of the wire type is also useful when afloat.

It should be remembered, however, when dealing with this particular subject that if the shutter of the lens is a high-speeded one it should never be used at more than $1/2000$ th sec. for any sea subject, or the water, if there is much movement or spray, will appear frozen and lifeless. If the light is very bright a smaller stop or a slower film should be used.

In any case, films of the 'chrome type, in conjunction with a colour filter, will give good results all the time, although occasionally for very striking colour effects panchromatic films and a filter will be found better.

F. J. M.

FISHERMAN'S BEACH. Taken from the pier. $1/1000$ th sec., $f/11$, Selochrome.

especially if a fairly high viewpoint is chosen.

Again, if he is situated where there are fishing-boats, a high viewpoint from the end of the pier will sometimes give him an original and attractive composition, while if there are rocks in the neighbourhood opportunities frequently occur of securing a real seascape, with rolling breakers, which compare in a lesser degree with the bigger wave studies to be obtained in the winter-time.

RATERS. $1/1000$ th sec., $f/16$, Selochrome.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXCV.

Mrs. ROWENA
BROWNELL.

From information communicated to our Special Representative.

"PHOTOGRAPHY, though it seems so easy of appreciation, even so simple of realisation when we start work, has an unending list of problems to stimulate our interest and command our respect. Each worker must eventually find his own approach, and keep his aim steadily in mind, if he is to feel repaid for his effort. Beyond the point when the necessary technique has become a matter of routine, we interpret a subject only to the extent of our ability to appreciate it. Light, shadow, pattern, mood—what each of

us feels most is what shows in the result; otherwise given the same excellent tools and opportunities, results would be uniform.

"As we progress, our understanding should likewise broaden our insight into others' work. One way to accomplish this is to study reproductions in books and magazines and prints in exhibitions, trying always to see the meaning of the photograph and how the result was achieved. Possibly the maker of the print has succeeded in showing a combination of textures which interested him, or a pattern of

sunlight on a wall, and if he convinces us of a beauty which he sensed and which we have missed we will certainly be more alert the next time that a similar chance offers itself. By this I most emphatically do not advocate trying to do the same type of subject matter in his way—style in subject matter as well as in processes changes, and while each of us naturally has preferences, it is foolish prejudice to refuse to concede the worth of another's choice.

"Personally, I much prefer a straight print from an unretouched negative, and always work with that end in view; most of the time using a reflex, carefully composing on the ground glass, and determining when making the exposure the development that is to follow, and usually the type paper which it is desirable to use in the final print. Most of these are 11x14, and as a rule there are not any preliminary small prints made, since what may make an excellent 5x7 may be of little interest in a print to be hung on the wall. The latter requires mass in composition, and good print quality as well, and the rare negative which offers those with a freshness free from retouching is a joy which repays one for the average. A print which can bear careful scrutiny—ferrotyped, if need be, and still have quality—that is the kind.

"The longer I work the more convinced I am that 99 per cent of effort expended should be in studying the lighting. Mazdas, two 500's in standards, combined with daylight are capable of great variety and are comparatively inexpensive. It is, of course, useless to pose a figure or a still-life group in one light and then change the direction or balance of the lighting. The light is the picture."

(A further example of Mrs. Rowena Brownell's work is reproduced on the opposite page.)

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

WITHIN the next few months, or weeks, or it may even be days, those of us who are lucky enough to be able to do so will be saying goodbye to the cares of business and the everyday round and departing for our holidays with the strong hope and belief that we shall bring back with us a good bag of negatives that will be better than ever before.

Holiday Photography.

Naturally, we share in such an anticipation, but there is one thing we must do—if it has not already been done—and that is to make sure our cameras and accessories are in sound working order. The only really effective method is first to give the instrument a good examination, making sure that all the movements are working and are not impaired by a period of disuse; that there is no looseness or play in any of the parts; that the back and front are in perfect parallelism and rigid when extended; that lens and camera are clean and free from dust; and that the shutter, as far as can be seen, is working as smartly and well as usual.

And secondly, when all this has been done, a film should be passed through the camera, exposed and developed, on something in the nature of a test subject, such as, for example, a hoarding covered with printed posters. Examination of the film under a magnifier will soon show if any fault requires rectification, and what action is needful can be put in hand in time. Needless to say, the camera, during the test, should be firmly supported, preferably on a tripod, and every care taken to avoid movement during exposure.

Then we can go away secure in the knowledge that our camera will not let us down, and can tackle anything we see with confidence and equanimity. And confidence is half the battle. If we see a thing and feel we can do it, it is almost as good as done.

Choosing a Subject.

Whether any of the prints reproduced on the opposite page are holiday efforts or not, history does not relate, but No. 2, "Morning, Lambeth Bridge," by W. M. Richardson, with its fine arrangement and very pleasing effect of sunshine, shows the sort of thing that might well be taken as an example.

It might be better, perhaps, if a fraction could be added at the top to give the buildings a bit more space, and if that little piece of light on the right between the buttress and the edge were removed by trimming, but, apart from that, I do not see that the print wants

any alteration, and, in an enlarged edition, it might be submitted for exhibition with not a little prospect of success.

As a picture, it attains a high level in its class and is most attractive. It was very well seen indeed, but imagine the disappointment and chagrin if, when development were completed, a band of fog appeared stretching from one corner towards the centre; a part of the image were out of focus; or a circle of heavy density occurred in the middle of the negative, any one or more of which might happen if the camera were taken out for the first time after a period of laying up.

Possible Effects.

The first of the defects quoted might arise from an unsuspected pinhole in the camera bellows; the second through incorrect alignment between the front and back, or a looseness of the panel carrying the lens; and the last by the shutter failing to close.

A preliminary examination and excursion as previously recommended would have made evident the existence of the faults and enabled them to receive attention at the proper time or before any vitally important and irreplaceable holiday subjects had been spoilt.

However, reverting to the question of choice of subject, "Austin's Bay" (3), by W. J. Batts, is another example of the sort of thing that might be tried. Like No. 2, it is characterised by a very nice appreciation of the value of an effect, the sunlit cliffs standing out against the well-clouded sky in fine and impressive fashion. It differs from the print formerly discussed in that it is a seaside, as distinct from a town, subject, and as, no doubt, the majority of holiday-makers will visit the sea rather than go to town, it may be a more generally useful type for emulation.

It very certainly shows the added pictorial value that is gained from the incorporation of an effect of nature, though, to be perfectly candid, I should have preferred to have seen it with quite a bit more sky and less of that wide expanse of foreground.

Effect and the Picture.

As a picture, No. 4, "Landscape," by Khushi Mohd, is scarcely so successful. It does contain a good sky and the proportion of picture space allocated to it makes it more effectively brought forward than that of No. 3, but it is not sufficiently strong to maintain the main interest, and the remainder of the scene, with its stretch of unattractive roadway, is most uninspiring.

The figures are the making of No. 1, "Gossips," by M. Copnall, though, as a subsidiary feature, the sunshine lends the subject an additional appeal.

It could be wished, perhaps, that there were just a little more space between the one on the left and the side of the arch, and a change of stance to a point a foot or so to the right would have brought them into a more effective position. Apart from this, they are very well caught, and the print provides yet another suggestion of the sort of thing to look for during the holiday.

At the seaside, there are many opportunities of securing figure studies of outstanding quality. There are generally fishermen and their boats somewhere about, and, whether they are busy with their multitudinous jobs or idling in groups along the quays, they make fine pictures for those who have the patience to wait until they dispose themselves satisfactorily.

In the Countryside.

For those who like to spend their holiday on moor or fell or in the country, remote from town or sea, landscape offers so many problems that it cannot fail to be absorbing.

Tree studies, such as No. 5, "Silver Birches," by A. Morris, are available in infinite variety, and, with colour so predominant a feature, a light filter will be found a most useful accessory. Against-the-light effects, like No. 6, "The Naturalist," by I. R. Robertson, can also be essayed, but, wherever you go and whatever you do, I wish you the best of luck with your holiday snapshots.

Applied Knowledge.

In my own mind I entertain another wish, or rather a hope; and that is, that those who have been studying this critical page week by week may find that they have gained by so doing. The real purpose of these criticisms is to build up, by degrees, a knowledge of what to avoid and what to aim at when taking photographs, whether they are intended as mere records or as essays in picture-making.

The knowledge so gained is not always definitely recognised. We may not do this thing, or avoid that, because we recall advice given to someone else on these points. To do what is best in given circumstances becomes after a time almost automatic—we do it instinctively. At the same time there are occasions when we have to consider, and plan, and balance one thing against another, and it is then that our previous study comes to our assistance and helps us out.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

SUMMER ON THE RIVER.

I HAVE just spent a couple of days making a leisurely trip from Windsor to Henley and back again, partly to get a few illustrations for these notes. Before I went aboard the lugger at Windsor the rain began, and continued at intervals for most of the day. The next day was better, but variable; and I nearly drew a photographic blank, especially when I discovered that my camera had been playing an absolutely new and unexpected prank.

So far from these things discouraging me I am making them the excuse for doing the trip all over again; and then I hope to do another on still higher reaches, and another on the lower reaches, and another on a different river altogether. For all over the country are beautiful and interesting rivers, providing endless photographic subjects, and generally accessible by some form of water transport.

No doubt the photographer is lucky who has his own vessel and can go

An Evening Spin.

prospecting for subjects at leisure; but most of us have to rely on service boats, and we might do worse. There are drawbacks in a vessel so crowded

that our movements are restricted, but this can generally be avoided by some care in selecting routes and times.

The beginner will find no special difficulties in using his camera from a boat, but there are a few snags of which he should be aware.

Ordinary roll film, or orthochromatic plates, will be found suitable. In spring and summer, greens are likely to predominate in river landscapes, and some ortho materials will give a better account of these than some panchromatics, although these would be a great advantage in the autumn. Whether a filter can be used depends on weather conditions and the largest stop available.

A lens hood should certainly be used if possible, as many subjects will be taken more or less against the light. The mere windings of a river bring about constant changes in the direction of the light as well as in the variety and arrangement of subjects. Even with a slowly moving vessel it is necessary to be mighty quick in getting some of the subjects on the banks close at hand. They open up and change and vanish with startling rapidity. The man who hesitates is lost. Many good things will be missed,

Windsor Castle.

Boat-houses.

but there is a good deal of excitement in the rapid spotting and shooting of others.

If the shutter has a single speed only it will be safe for most of the work, but not for close-up shots of vessels moving in the opposite direction to the photographer's boat. I would suggest $\frac{1}{50}$ th of a second as a good average speed if it is available. I kept my own shutter set at the same speed most of the time, and varied the stops according to light and subject.

Vibration of the boat may be noticeable, and the camera should not be rested on any part of the vessel. Anyhow, a fairly fast shutter speed is necessary even if only to deal with the movements of the water surface.

There is no one position on a river boat that is better than all others for providing opportunities for shots. Near the bow, or near the stern, are good spots, especially if it is possible to move from one quarter to the other. On a quiet river, subjects ahead may have clear, undistorted reflections, as in the tiny top print of the types of

boats, while subjects astern may show the reflections broken by the wake of the boat, as in the print of boat-houses.

Rivers vary enormously in character, and I think the beginner's aim might

In Boulter's Lock.

well be to try to get a small set of prints that will convey the particular character of the stretch of river he has traversed. Even with luck against me I nearly managed this with the Thames trip. I could do it better after ten trips. W. L. F. W.

Odd Craft.

Early Morning at Henley.

MAKING BETTER SNAPSHOTS-7

By DAVID CHARLES.

This article is the seventh of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. With the right lighting, and the right exposure, sea and sky make a splendid background.

Fig. 2. Taken with the camera facing brilliant light, an indistinct image results.

Fig. 3. Against the sky, a sun-browned face is liable to "come out" even darker than it looks.

SUNSHINE by the sea is presumed to comprise the snapshotter's paradise. And so, in most respects, it does.

The fly in the ointment arises out of the fact that the foreshore is often crowded and that most of the crowd (including the photographers) spend their time looking seawards. Do you ever recollect having noticed anyone with his, or her, deck-chair turned towards the land?

A look towards the land with one's back to the sea reveals a jumbled mosaic of bodies and boulders, chairs and kiosks, and hundreds of other things which do not make for a satisfactory background for the subjects most people find it essential to photograph—to wit, their relatives and friends. So they make the sea their background; it is simple and undistracting, and anyway they are facing it already. And the sea can make a very good background, too, as witnessed Fig. 1.

But at the start of a photographic career it is not always realised that to adopt this procedure is often to ask for trouble. The tremendous expanse of brilliantly-lit open sea and sky floods the inside of the camera with volumes of light. The effect inside the camera, if only one could observe it, is very similar to that which causes many

people to screw up their eyes in such circumstances. The camera is much like the human eye in its liability to be "dazzled," and in those circumstances produces an indistinct image like that of Fig. 2.

That in itself would be bad enough. But in many seaside places looking seawards means looking actually towards the sun for the best part of the day, and everybody knows that gazing sunwards dazzles the eyes worst of all. And so with a camera. On the South Coast this condition obtains all day, on the East Coast all the morning, and on the West Coast all the afternoon, as will be realised by reference to Fig. 5. I am quite well aware that the coastline possesses numerous convolutions, so that the rule of the diagram need not be taken too literally. It serves rather as a warning that the position of the sun needs to be remembered.

Even when not facing open sea, and even if the sky is obscured, it is very desirable to bear in mind certain things if one uses these masses of light as "plain backgrounds." One is that not only is the subject very much darker in actual fact than the general lighting conditions appear to indicate to the inexperienced eye, but since the photographer is looking towards the source of the brightest light, the latter is actually illuminating mainly the back of his subjects, which he is not photographing. It is their fronts which he aims his camera at, and it is the volume of light from his own back which he should take more notice of. If there is a tall cliff behind him, for instance, and if his friends are at all sunburned, it is well to remember that a poorly-lit brown is not too far removed from black.

And black, if he ignores these points, will his friends appear in the prints.

Fig. 4. But if the face is brightly lighted, the sky may safely be used as background.

Fig. 5. How sunlight falls at different times of the day.

Photographing Sideways

By PAUL CONNELLY.

WHAT is commonly called "candid-camera" work, and other varieties of photography, too, may be divided into the two sections—discovering the subject and "sniping" him. The first is mental perception of the subject; the second is the mechanical operation of photographing.

The problem of obtaining skill in swift sniping at the precise instant is really three separate problems, all of which have to be solved at the same time by means of the fingers! But it is not so difficult as that may sound, if the matter is taken in hand logically. First,

2.—Using an angle-finder with lens towards the right-hand side, the camera is above the finder. Note how the left thumb is "fitted" to the nose, and the forefinger to the forehead; this arrangement keeps the view-finder definitely fixed in alignment with the right eye. The fingers of the right hand also help to support the camera, while the thumb is ready to press the exposure-button.

it is necessary that one should be able to sight the subject in the view-finder while moving the camera. This means that the head and the camera should turn as one inseparable piece of mechanism. The second essential is that the camera should be supported steadily without strain or discomfort. The third is that although the disposition of the hands may have to be different from one's customary camera-hold, the trigger-finger must still remain perfectly free and ready.

To achieve these three essentials there are some details of method which are common to all cameras. Whether the camera is used at waist-level or at eye-level (the latter obviously being better for this work) the arms are pressed closely to the trunk, so that a turn of the camera towards one side or the other means revolving the whole body, as one solid mass. If this sounds a ponderous proceeding, it is not so in practice. In fact, it is quite easy to make a complete half-circle turn as quickly or slowly as may be desired, as shown in Fig. 1. When working near

1.—By planting the feet slightly apart a complete half-circle can be made from right to left or vice versa, without moving eye from view-finder. For cameras not fitted with an angle-finder this method is the best, whether held at eye or waist level. Note the arms are pressed firmly and closely to the sides of the body.

victims inclined to be suspicious, it is a great thing to have one's lens apparently sweeping the

The trouble is that a camera is not built to fit the face. To fix it against the face, so that the eye and view-finder remain in alignment both comfortably and steadily, one has attained a habit of making the fingers which grip the camera form a firm pad which fits it to certain hard parts of one's skull.

The accompanying illustrations will be found a very useful basis upon which slight variations of grip can be made by the individual worker. It should be noted that the only points of real pressure are the arms to the chest, and the finger to the face. All the other muscles of body and fingers should be kept relaxed, and no more rigidly tensed than is sufficient to prevent the camera falling. In that last remark lies the secret of painless waiting, and of jerkless shooting when the instant arrives.

3.—Using an angle-finder with lens pointing to the left, the camera is below the finder. Note the left forefinger pressed along the bones of jaw and nose, with the right forefinger arched over the trigger-button. Here the right eye is also being used.

horizon. With any camera at eye-level the thumbs form two points of support, the third point of support being the bony structure of the face.

4.—When using a twin-lens reflex aimed sideways there is the considerable leverage of its weight to overcome. Note the disposition of the thumbs and third fingers to overcome this. The front of the hood is pressed against the nose, and the magnifier must be used, or the image cannot be properly seen at such close quarters. For using the opposite eye to that shown in these illustrations some variation in the "hold" is necessary, which a little individual experiment will discover.

Pictures in the Making

A Commentary on the Pictures reproduced in this issue.

NOT a little of the care-free spirit of summer and holiday time is conveyed in this picture by E. SCHNEIDER, "SUMMER LANDSCAPE,"

and there is, besides, a fine impression of sunlight and the open air, effects which show us the sort of thing to aim for when the opportunity offers.

And now is the time to go out and get them. At no other season are the daylight hours so long; sunshine is more prevalent; and weather conditions are such as to invite us to make the most of them before the winter comes and curtails our opportunities. We may, perhaps, not always be so fortunate as to chance upon so charming a model and so attractive a setting, but, if we are always on the look-out and always prepared, the unexpected may happen.

Here, the probabilities are that the co-operation of the figure was enlisted; that she was brought upon the scene after its possibilities had been carefully estimated; that she was posed in various positions until the present placing against the dark of the mill was finally chosen; and that, possibly on account of her attention being momentarily attracted by another member of the party and the vivacity of her expression being instantly appreciated, the chance was taken immediately it happened. At least, that is how it seems to me that the picture was secured, and, if it did not actually happen precisely in that way, it is a sound method of working.

Chance, however, does play a part. It was chance, no doubt, that caused the turn of the head and the smile, but the worker, quite evidently, was ready, and took immediate advantage of it. It reminds me of a time when I was in a little Italian town and was engrossed in trying to make something of a play of sunshine and shadow upon a rough-

cast wall, on which were placed a balcony and a number of gratings. These projected a little, and accounted for the shadows. The subject, in itself, was, I felt, worth a plate, and I was just about to make my exposure when the shutters of one of the balconies was thrown open and a girl appeared who started watering the few plants that were there. I got her at once, but then she saw the camera and vanished indoors. I was not, however, sure that the shutter speed was short enough to prevent movement of the image, although, when I got home and developed the plate, I found there was not enough to matter.

That such a figure should come along just as it did was a chance in a million, but, some youngsters turning up and becoming interested in what I was doing, I first of all showed them the image on the reflex focussing screen and

eventually persuaded them to group themselves at the base of one of the long falling shadows. They entered into the spirit of the thing, posed as I told them, and kept their positions while I made another exposure. This last turned out a better thing than the first, but, as a rule, I prefer to wait until a suitable figure turns up rather than make use of models, for, apart from the difficulty of getting a sufficient variety, the unsuspecting and involuntary figure usually seems more spontaneous.

However, most workers would rather proceed along lines they have developed for themselves, and, if they find a model better suited to their methods than a chance figure, or, for that matter, a set of figures, it is better that they stick to the lines they have found successful

than attempt a method with which they are not familiar.

Nothing, for example, could be more spontaneous and natural than "THE BATHING-POOL," by M. RODRIGUE, and it certainly could not have been posed. There are too many figures for that, and if, as is sometimes done with a cinema chorus, an effort were made to drill a lot like this into posing for a shot, something or other would happen, as it usually does with such things, to indicate the presence of the camera. Whereupon all its naturalness and spontaneity would go. The expedient might be successful with two or three figures, but not with such a crowd as this, and, if I were told that this had been deliberately posed, quite frankly, I should not believe it.

I could easily credit it if it were said that the arrangement was the result of a careful choice of the moment for making the exposure, nevertheless, and, in all probability, that is what was done. The grouping, taking into account the nature of the subject, is excellent.

But composition and design at its best is generally to be found where exists the facility for arranging and adjusting the subject itself, as it does in "QUEEN ANNE'S LACE," by ROWENA BROWNELL. The form of the flowers is seen to full advantage, the shapes of vase and bowl provide curves of harmonious design, and the lines of the setting are well calculated to set them forth. The arrangement is wholly admirable and a like perfection extends to the chiaroscuro or relationship of the light and shade, while the beauty of the key, with its exquisite transitions of delicate tone, is as good as anything I have seen, of its type, since the days of the Cadbys, who, perhaps, were the

(From the Advanced Workers' Competition).

By W. J. ALLAM.

Pictures in the Making—continued.

first to make a success of photography in a high key.

The next two pictures, which face each other on the centre page, are the subject

of another article, but in connection with the first, "REPOSE," it will be seen how fully the intentions of the title are expressed in the print, and how admirably use has been made of the static qualities of horizontal and vertical lines.

Except for a small relief here and there, all the lines are either vertical or of a horizontal tendency. The hulls of the vessels are mainly represented by horizontals, and their sails and the reflections are made up of verticals, although, as far as the reflections are concerned, the ripples also introduce a horizontal suggestion. The limpidity of the water, too, is finely conveyed, and the subject provides an illustration of an unusual form of arrangement in which the more distant of two elements forms the centre of interest. This point occurs where the sunshine strikes

the hull and sail of the far boat at (1). This point makes the strongest light of the picture; it has considerable force of position; and it is emphasised, almost to a dramatic extent, by the imitation afforded by the reflections below.

"ACTION," however, shows a strong contrast of mood. It gets across with its suggestion equally well, and, just as the predominating verticals and horizontals of the other combined to convey an impression of peace and quietude, the opposite feeling, here, is transmitted by the prevalence of lines of a slanting inclination.

There is one strong line rising from the bottom left-hand corner, it being extended, by the ropes, to its opposite on the right-hand side; there is the line of spray on the bottom right inclining towards the left; in the upper left-hand side, another line comes downwards towards the figure; and, from the top, there is a triangular projection made up of boundary lines of opposing tendencies. The only horizontal line of any significance is that of the horizon, and this does but serve to emphasise the overwhelming dominance of lines on the slant. From these arise a most forceful suggestion of movement.

The tendency is still further exempli-

fied by the following picture—"YOUTH," by B. I. P. KENT—where, although a figure study and of a very different character to its predecessor, inclined lines in opposition convey a like impression of movement and action. The body is leaning backwards from right to left. The near thigh provides a strong opposition and is also on the slant, the two inclined lines enforcing each other, while the farther leg and torso make a fine sweeping curve.

Flying off at a tangent, the arms again emphasise the inclination of the body, and therewith the impression of motion is further stressed, while the level line of the horizon only serves, as in the former case, to heighten the feeling.

Besides this, there is a feeling of open air and space; a suggestion of light and luminosity; and of that freedom of

spirit that is suggestive of holiday time and the present season. The pose is exceedingly well caught, and, presumably, has been obtained with the able co-operation of the model, for, unless one should be fortunate enough to come across a dancing-school at practice or something of the sort, the chance of securing a similarly posed figure is so remote as to be almost impossible.

But those of us who are confined to town need not despair of finding subjects

at this time of year, as "SUMMERTIME IN TOWN," by W. J. ALLAM, well shows.

Here, the main source of appeal is to be seen in the effect of sunshine on the light-toned building towards the right. The sunlight makes it seem even brighter than the sky, against which its brilliance shows up magnificently. The effect is enhanced by the depth of tone in the foliage below and in the contrast afforded by the shadow side of the building itself. The variations of tone in the foliage, too, provide yet a further attraction, while the beautifully clouded sky rounds off and completes an admirably chosen subject.

Incidentally, the picture is one which displays a sane and well-ordered employment of a high viewpoint. There is no suggestion of the distortion so favoured by the "new angle" school, which arises from a violent departure from the normal line of sight. This is avoided simply because the normal direction of view was retained and the height of the viewpoint adopted for the reason that the subject could only be obtained from it, for the building would scarcely be visible from the street level, and, if it were omitted, most of the attraction of the subject would be lost.

The foliage on the left, if a little "bitty" in character, provides a means of stopping a tendency, that would otherwise make itself felt, for the lines in perspective to run out of the picture on that side. It makes an efficient closing line and very well serves to turn the interest well into the picture. An excellent piece of work. "MENTOR."

Popular-Size Snapshot Cameras

IN spite of the ever-growing popularity of miniature cameras of various sizes, there can be no doubt that the most popular single size of camera in use to-day is that taking pictures $3\frac{1}{4} \times 2\frac{1}{4}$ in. This popularity has been at once recognised and fostered by the film-makers, who offer film at a decidedly lower price, for its area, in that size than in any other.

At this holiday season many thousands of amateur photographers will be buying or replacing their cameras, and in order that our readers may have the fullest information, for their own use or for advising their less expert friends, we publish below a brief description of the $3\frac{1}{4} \times 2\frac{1}{4}$ in. folding roll-film cameras on the British market. We believe the list to be exhaustive.

Entries are arranged in rising order of price, the figure chosen, in cases where several different lens-shutter equipments are offered, being in all cases the lowest. Other available equipments, with prices, will be found in the complete price list on page 90. In this the letter S following the name of the shutter signifies that it has delayed-action release for self-portraiture.

Box cameras of all sizes were described in our Novices' Number published on June 2nd last, and all smaller cameras in our Miniature Camera Number of March 10th. Cameras taking $3\frac{1}{2} \times 2\frac{1}{2}$ in. plates will be described in next week's issue.

For firms' addresses see advertisement pages.

MYNA, ALL DISTANCE.—Folding camera with all-metal body, fitted with $f/11$ single Meniscus or $f/11$ Doublet lens in Time and Instantaneous shutter. Two-point focussing. Dimensions, $6\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{4}$ in.; weight, 18 oz. Prices from 15s. Soho, Ltd.

MENISCUS FOLDING POCKET CAMERA.—Folding camera, fitted 4-in. $f/11$ single lens in Time and Instantaneous shutter. Two-point focussing for infinity and 9 ft. Large reversible brilliant

finder. Dimensions, $6 \times 3\frac{1}{4} \times 1\frac{1}{4}$ in.; weight, 14½ oz. Price 18s. 6d. Coronet Camera Co.

SIX-20 FOLDING BROWNIE.—A simple self-erecting camera, fitted with single lens in Time and Instantaneous shutter. No focussing arrangement is fitted. Has folding direct-vision finder.

The back hinges open for loading, and the camera uses 620 spools. Dimensions,

$6 \times 3 \times 1\frac{1}{4}$ in.; weight, 18 oz. Price £1 7s. 6d. Kodak, Ltd.

EVERY DISTANCE FOLDING CAMERA.—Self-erecting folding camera fitted 4-in. $f/11$ Every-Distance lens in Time and Instantaneous shutter. Has reversible view-finder and two tripod

bushes. Dimensions, $6 \times 3\frac{1}{4} \times 1\frac{1}{4}$ in.; weight, 15½ oz. Price 25s. Coronet Camera Co.

ENSIGN POCKET 20.—Folding camera, fitted 4-in. $f/11$ Meniscus lens, with two stops, in I.B.T. shutter. Reversible

brilliant view-finder. Two-point focussing. Available also with $f/8.5$ anastigmat lens in three-speed shutter. Dimensions, $6\frac{1}{2} \times 3\frac{1}{4} \times 1\frac{1}{4}$ in.; weight, 18 oz. Prices from £1 7s. 6d. Ensign, Ltd.

CADET.—Folding roll-film camera with polished moulded body. Has single $f/11$ lens in Time and Instantaneous shutter. Two-point focussing by pulling forward camera front. Has reversible brilliant finders. Dimensions, $7 \times 3\frac{1}{2} \times 1\frac{1}{4}$ in.; weight, 19½ oz. Price 25s. Also obtainable with $f/11$ Doublet lens at 30s. Soho, Ltd.

ANASTIGMAT FOLDING POCKET CAMERA.—Self-erecting folding camera. Fitted anastigmat lens, with iris diaphragm, mounted in multi-speed

shutter. Reversible view-finder, two tripod bushes. Dimensions, $6 \times 3\frac{1}{4} \times 1\frac{1}{4}$ in.; weight, 16 oz. Prices from 35s. Coronet Camera Co.

ALTREX.—Folding camera, fitted with $f/11$ single or doublet lens in three-speed shutter. Focussing by scale. Has brilliant reversible view-finder and pressure plate to ensure the film being in register. Dimensions, $6\frac{1}{2} \times 2\frac{1}{2} \times 1\frac{1}{4}$ in.; weight, 16½ oz. Prices from £2 2s. Soho, Ltd.

SPEEDEX CLACK 74.—Collapsible self-erecting camera, fitted with Bilinar doublet lens, aperture $f/11$, with stops for $f/16$ and $f/22$. Time and Instantaneous shutter. Built-in portrait lens for

close-ups. Two brilliant finders and one frame finder. Dimensions, $6 \times 3 \times 1\frac{1}{4}$ in.; weight, 19½ oz. Price £1 16s. Agfa Photo Ltd.

SIX-20 KODAK JUNIOR.—Self-erecting folding camera, with choice of 10-cm. lenses fitted in between-lens shutter. Focussing by rotating lens-cell.

The camera has a brilliant view-finder and in the two de Luxe models a folding direct-vision finder is also fitted. Shutter and stop settings visible from top of camera. Takes 620 spool. Dimensions, $6 \times 3 \times 1\frac{1}{4}$ in.; weight, 18 oz. Prices from £1 19s. 6d. Kodak Ltd.

WESTEX JUNIOR.—Specification as Westex Four-Five, but without mask for half-size pictures. Fitted 10.6-cm. $f/6.3$ anastigmat in Vario three-speed shutter. Weight, 21 oz. Price £2 2s. 6d. Westminster Photographic Exchange, Ltd.

SELFIX-20.—Self-erecting folding camera, fitted 10-cm. anastigmat lens in between-lens shutter. Focussing to 3½ ft. by rotating front cell. Has detachable mask for half-size pictures.

Brilliant and optical direct-vision finders, the latter fitted with mask. Dimensions, 5½×3×1½ in.; weight, 21 oz. Prices from £2 5s. Ensign, Ltd.

SIX-20 JIFFY KODAK.—Collapsible camera, with spring-out front, no base-board. Fitted with Twindar f/11 lens in focussing mount. Built-in shutter with Time and Instantaneous speeds. Two brilliant finders. Uses 620 spool. Dimensions, 6½×3½×1½ in.; weight, 18 oz. Price £2 10s. Kodak Ltd.

BESSA.—Folding self-erecting camera, fitted with an anastigmat lens, focussing by front cell. f/7.7 and f/6.3 lenses have three-point focussing, but faster lenses are scaled in feet. Has both direct-vision and brilliant finders, with optional mask to direct-vision finder

only. Mask for half-size pictures supplied. Takes either metal or wooden-cored spools. Shutter release in all models under baseboard. Dimensions, 6½×3½×1½ in.; weight, 20-22 oz., according to lens and shutter. Prices from £2 12s. 6d. Schering, Ltd.

OWL No. 4.—Self-erecting folding camera, fitted 10.5-cm. f/4.5 Wray Supar anastigmat in focussing mount. Three-speed shutter, brilliant and eye-level finders. Dimensions, 6½×3×1½ in.; weight, 23 oz. Price £2 15s. Dollond & Aitchison, Ltd.

NETTAR 510/2.—Self-erecting folding camera with f/7.7 Nettar anastigmat of focal length 4½ in., focussing by front cell to 6 ft. Automat or Automat S.

shutter. Dimensions, 6×3½×1½ in.; weight, 20 oz. Prices from £2 12s. 6d. Zeiss Ikon, Ltd.

THE VAUXHALL WONDER.—Self-erecting folding camera, fitted 10.5 f/4.5 Victor lens in three-speed shutter. Focussing to 7 ft. by front cell. Fitted folding frame and brilliant finders.

Junior model takes 2½×3½ pictures only. Standard model is fitted with mask to camera and finder for half-size pictures. Dimensions, 6½×3½×1½ in.; weight, 20 oz. Prices from £2 15s. 6d. Camera Co.

SPEEDEX RECORD (Model I).—Self-erecting folding camera, fitted f/7.7

Igestar lens in three-speed shutter with delayed action. Brilliant and direct finders. Two-point focussing, reverting

automatically to infinity when camera is closed. Dimensions, 6½×3×1½ in.; weight, 22 oz. Price £3 10s. Agfa Photo, Ltd.

CADET F/6.3.—Specification as Cadet, but fitted f/6.3 anastigmat, with iris diaphragm, in three-speed delayed-action shutter. Price £2 15s. Soho, Ltd.

SIX-20 KODAK.—Self-erecting folding camera, fitted with anastigmat lens of focal length 10.5 cm., in between-lens shutter. Focussing by front cell to 3½ ft. Has both direct and brilliant

finders. Swing-out spool holders for easy loading with 620 spool. Dimensions, 6×3×1½ in.; weight, 24 oz. Prices from £3 12s. 6d. Kodak Ltd.

NETTAR 515/2.—Self-erecting folding camera with anastigmat lens in between-lens shutter. Focussing to 6 ft. by front cell. Has both direct-vision frame and brilliant finders. Models fitted with f/4.5 lens have shutter release on body of camera. Dimensions, 6×3½×1½ in.; weight from 20 oz., according to lens and shutter. Prices from £3 15s. Zeiss Ikon, Ltd.

SPEEDEX RECORD (Model II).—Specification as Model I, except that f/6.3 Igestar lens is fitted and there is a mask for taking half-size pictures if desired. Price £4 4s. Agfa Photo, Ltd.

AUTO ULTRIX.—Self-erecting folding camera. Fitted 10.5-cm. f/4.5 Ihagee anastigmat in between-lens shutter. Helical focussing mount controlled by lever, for distances to 7 ft. Brilliant and

folding frame finders. Two tripod bushes. Dimensions, 6½×3½×1½ in.; weight, 19 oz. Prices from £4 4s., according to shutter. Garner & Jones, Ltd.

WESTEX "FOUR-FIVE."—Self-erecting folding camera, fitted direct-vision optical and brilliant finders. Has 10.5-cm. f/4.5 anastigmat in Prontor delayed-action shutter, focussing by front cell. Has mask for half-size

pictures. Dimensions, 6½×3½×1½ in.; weight, 23 oz. Price £4 8s. 6d.

Westminster Photographic Exchange, Ltd.

CERTIX MODEL B.—Camera specification as Model A, except that mask for half-pictures is supplied, and shutter release is on body of camera. The release sinks flush into top of camera when this is closed. Direct-vision optical finder only. With 10.5-cm. anastigmat lens in between-lens shutter. Weight, 19 oz. Prices from £4 17s. 6d. Actina, Ltd.

NORFOLK ROLL FILM.—Folding self-erecting camera, fitted 10.5-cm. f/3.8 Zernar lens in between-lens shutter. Direct-vision and brilliant finders. Fitted with masks to camera and view-finder for half-size pictures.

Focussing by front cell. Dimensions, 6½×3×1½ in.; weight, 18 oz. Prices from £4 19s. 6d. Sheffield Photo Co., Ltd.

THE SPEEDEX RECORD (Prontor).—Self-erecting folding camera, fitted f/4.5 Apotar anastigmat, focussing to 3 ft. by rotating lens cell. Prontor II shutter with delayed action. Brilliant and folding frame finders. Dimensions, 6×3×1½ in.; weight, 23 oz. Price £5 5s. Agfa Photo, Ltd.

PONTINA (Gloria).—Self-erecting folding camera, fitted 10-cm. f/4.5

Trioplan lens in between-lens shutter. Front-cell focussing. Folding optical

direct-vision and brilliant view-finders. Camera has mask for half-size pictures. Dimensions $6 \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 19 oz. Prices from £5 15s., according to shutter.

Norse Trading Co., Ltd.

TROPICAL ENSIGN 20.—Folding single-extension camera, with focussing by radial lever. Fitted $f/4.5$ lens in between-lens shutter. Rising and cross front. Has reversible brilliant and wire frame finders. Metal body finished in Florentine bronze lacquer. Prices from £5 15s.

Ensign, Ltd.

VAUXHALL DE LUXE ROLL-FILM CAMERA.—Self-erecting folding camera, fitted 10.5-cm. $f/3.8$ Trinar lens in delayed-action Compur shutter. Focussing to 5 ft. by rotating lens cell. Plunger release to shutter. Fitted direct-vision optical and brilliant finders. Camera and finder have mask for half-size pictures. Dimensions, $6\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 24 oz. Price £5 17s. 6d.

Camera Co.

CERTIX MODEL A.—Self-erecting folding camera, fitted 10.5-cm. $f/4.5$ Actinar lens in Prontor-S shutter.

Focussing by front cell. Direct-vision and brilliant view-finders. Dimensions, $6 \times 2\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 18 oz. Price £5 19s. 6d.

Actina, Ltd.

SPEEDEX COMPUR.—Specification as Speedex Record Prontor, except that the direct-vision finder is of optical pattern and Compur shutters

are fitted. Dimensions, $6 \times 3 \times 1\frac{1}{2}$ in.; weight, 23 oz. Prices from £6 6s., according to lens and shutter.

Agfa Photo, Ltd.

WEROL III.—Self-erecting folding camera, fitted 10.5-cm. anastigmat lens in between-lens shutter. Focussing by front cell. Has both brilliant and folding frame view-finders. Dimensions, $6 \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 23 oz. Prices from £6 7s. 6d.

F. G. Phillips, Ltd.

PRONTOKLAPP.—Self-erecting folding camera, fitted 10.5-cm. anastigmat lens in between-lens shutter. Specification closely follows that of Citoklapp except that focussing is done by rotation of front cell of lens. Dimensions,

$6 \times 2\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 20 oz. Prices from £6 12s. 6d.

F. G. Phillips, Ltd.

CITOKLAPP.—Self-erecting folding camera, fitted 10.5-cm. anastigmat lens in between-lens shutter. Focussing by radial lever, which returns automatically to infinity when camera is closed. Has both brilliant and folding frame view-finders. Mask provided for taking half-size pictures. Dimensions, $6 \times 2\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 21 oz. Prices from £6 17s.

F. G. Phillips, Ltd.

AUTORANGE 20.—Folding single-extension camera, fitted with coupled range-finder. Focussing by radial lever to 4 ft. Rising and cross front. Fitted anastigmat lens in between-lens shutter.

Has detachable mask for half-size pictures. Direct-vision optical finder with mask, and brilliant finder. Dimensions, $7 \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 34 oz. Prices from £7 10s.

Ensign, Ltd.

FOCAL-PLANE AUTORANGE 20.—Specification as Autorange 20, except that focal-plane shutter, speeded $1/15$ th to $1/500$ th sec., is fitted, and an optical direct finder is not supplied. Prices from £8 15s.

Ensign, Ltd.

PENTAC ROLL-FILM CAMERA.—A folding roll-film camera, fitted $4\frac{1}{2}$ -in. $f/2.9$ Pentac lens in Compur shutter.

Rising and cross front. Focussing by radial lever. Double frame direct-vision view-finder. Dimensions, $8\frac{1}{2} \times 4 \times 2\frac{1}{2}$ in.; weight, 51 oz. Price £12 12s.

Dallmeyer, Ltd.

CLAROVID Model I.—Self-erecting folding camera, fitted with coupled range-finder. Focussing by rack and pinion. Fitted 10.5-cm. lens in Compur delayed-action shutter. Direct-vision optical view-finder. Has masking frame for half-size pictures. Dimensions, $6\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 27 oz. Prices from £13 10s.

F. G. Phillips, Ltd.

IKONTA 520/2.—Self-erecting folding camera, fitted $4\frac{1}{2}$ -in. Tessar lens in Compur Rapid shutter, with release on

camera body. Focussing by front cell. Fitted Albada direct-vision finder and reversible brilliant finder. Has optional mask for half-size pictures, and will

take either wood or metal cored spools. Dimensions, $6\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 24 oz. Prices from £12 17s. 6d.

Zeiss Ikon, Ltd.

CLAROVID Model II.—Specification as Clarovid Model I, except that range-finder is incorporated in view-finder, enabling focussing and field of view to be watched simultaneously.

Dimensions as Model I; weight, 28 oz. Prices from £15.

F. G. Phillips, Ltd.

RANGEFINDER BESSA.—Self-erecting folding camera, fitted with coupled range-finder. Fitted 10.5-cm. $f/3.5$ anastigmat in Compur Rapid shutter.

Focussing to 3 ft. by milled wheel on camera body. Depth-of-focus scale on focussing wheel. Shutter release under baseboard. Direct-vision optical finder, optional mask for half-size pictures, with self-contained mask to correspond in finder. Built-in yellow filter. Takes spools with wooden or metal cores. Dimensions, $6\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 26 oz. Prices from £16 10s.

Schering, Ltd.

SUPER IKONTA 530/2.—Self-erecting folding camera with coupled range-finder, operating on rotating wedge system. Fitted $4\frac{1}{2}$ -in. Tessar lens in

Compur shutter, with release on camera body. Direct-vision Albada finder, erecting automatically when camera is opened. Has optional mask for half-size pictures, and will take films on either metal or wood spool. Dimensions, $6 \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 28 oz. Prices from £19 12s. 6d.

Zeiss Ikon, Ltd.

THE REGENT.—Self-erecting folding camera, fitted with coupled range-finder. Focussing by rack and pinion. Fitted with Zeiss Tessar $f/4.5$ lens of focal length 10.5 cm., in Compur Rapid shutter with delayed action. Has

optional mask to allow half-size pictures to be taken, the direct-vision optical view-finder being masked to correspond. A special feature of the camera is its smooth streamlined outline free from projections. Takes 620 spool. Dimensions, $6\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 30 oz. Price £20.

Kodak, Ltd.

NEW SPECIAL ROLL-FILM SIBYL.—A roll-film model corresponding in every way with the New Special Sibyl

camera for plates. Dimensions, $8 \times 4\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 29 oz. Prices from £21 5s., according to lens.

Newman & Guardia, Ltd.

ICARETTE 551/2.—Double-extension folding camera for roll films or plates. Has rising and cross front, and lens and shutter are detachable. Focussing by rack and pinion. Maximum extension 7½ in. Fitted with mask for half-size pictures on roll film. Brilliant and Albada finders. Dimensions, 6½ × 3½ × 1½ in.; weight, 30 oz. Price, fitted with 4½-in. Tessar f/4.5, in Compur Rapid shutter, £21 7s. 6d., including focussing screen and three metal slides. Zeiss Ikon, Ltd.

SUPER IKONTA 531/2.—Specification generally as Model 530/2, but with shutter release interlocked with film-wind to prevent double exposure. An automatic signal shows whether the shutter has been released since the film was last wound on. Dimensions,

6 × 3½ × 1½ in.; weight, 29 oz. Price,

with f/3.8 Tessar in Compur Rapid shutter, £26 5s.
Zeiss Ikon, Ltd.

ROLL-FILM VESTA.—Folding camera for roll films or plates, with micro-

meter focussing. Camera front supported by lazy-tongs. Rising, falling and cross front. Fitted with Identoscope finder, automatically showing the correct view, even when front is raised. Fitted 4½-in. f/4.5 Xpres lens in Compur shutter. Dimensions, 7½ × 3½ × 1½ in.; weight, 32 oz. Price £30. Adams & Co., Ltd.

ROLL-FILM VERTO.—Folding double extension camera for roll films or plates. Specification exactly follows that of Verto folding plate camera. Focussing scales are provided for both roll films and plates, and both for the complete lens and for the separate components. Dimensions, 8 × 4 × 1½ in.; weight, 33 oz. Price, with 4-in. f/5.5 Combinable lens, £42. Adams & Co., Ltd.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

New Ideas in Your Holiday Film By SIGURD MOIR.

EVERY amateur cinematographer should make a holiday film. The work is not difficult, movement is plentiful and all other conditions are at least theoretically favourable.

Movement, real cinema movement, plays such an important part that it merits first consideration. In any holiday film it is especially valuable; in none is it more so than in the family vacation reel. Perhaps the fault rests entirely with the family, yet the fact remains that many personal films (like the average fellow's snapshots) raise hardly any interest in a remote outsider.

Here, then, is a convenient opportunity to widen the appeal. The whole family is about to go on holiday. Dull self-consciousness and other timidities, now, for a brief while, yield to the force of universal example. A whole range of settings is available. The floor is ready for the film.

Why a Holiday?

Don't rush the job on old, familiar lines, however. Attempt something new. Let your film begin by asking "Why a Holiday?" Father, mother, sister, brother can all supply you with the answer—and maybe you, too, feel the need of a change from the perpetual desk or the work-bench or the cares of running the domestic *ménage*.

Again it is sheer simplicity to tell this story through the medium of celluloid. Watch how father flops into his garden chair even before he goes in to tea. Notice the homely industry of mother and the girls. Take a glance at the boys—who really should be rolling the bumps out of that lawn. If you see all these things (and perchance the family does need a holiday), then your camera can see them just as vividly as you wish it to.

There is a further new angle in another question: "What Sort of a Holiday?" Almost invariably, the young find relaxation in active hours attended by unusual thrills. Yachts, bicycles, motor-cars, canvas tents and Hobson's choice—all win support from them. Mother, too, is usually a great sport; though she prefers to indulge from a spectator's point of view. Father just thinks he'd like to swap his garden seat for a deck chair at the seaside (only to join most actively in the fun and games as soon as he gets there).

And since most families decide in favour of the coast resorts, it is a fitting job for your camera quickly and entertainingly to show how they reach their decision. . . . enough has been written above to show how easily this may be done with simple,

suggestive shots—shots which can snappily marshal all the necessary points in the story and "put them over" in an economical footage of film.

The Familiar.

Those familiar "incident" shots (which have their place in every holiday film hitherto made) do not so easily lend themselves to new and better ideas. Nevertheless, they are frequently capable of much more effective filming—which must be almost entirely dependent upon your own imagination.

Exercise this imagination in every shot you take. Study from all angles the movement you wish to film. Include only such details as will be necessary to help the film along. Rigorously decide to leave out all things which have no place in the set plan. Particularly resist every temptation to film the extraneous "pretty-pretty"; shots of this description exist in abundance at each and all of the holiday resorts, but, if used without cause or alternatively inserted in the wrong place, they lead merely to confusion.

Further new ideas are available in the method of using the camera. All too

little camera movement is evident in the majority of holiday films, hence almost any sober movement is certain to make for novel relief. Try, for a beginning, some of the easier shots. Get out in a smoothly-moving craft and watch (through your view-finder) the effect of shooting other vessels, foreground studies, etc., in this way. In the harbour and other sheltered places, too, you can track up and away—after a little practice—in the most efficient, novel manner.

Similar facilities can be provided on shore by making a long "sand track" for carrying both you and the camera—mounted on a smooth board. Then there is usually at least one good shot to be obtained from the gliding car which moves both up and down the cliff face.

But do not concentrate entirely upon these moving shots. They are novel, of course; but purpose as well as novelty should govern the use of every device.

It remains now only to put a climax to the film and to end almost immediately upon that. In most holiday films, the climax naturally coincides with the return home. The theme "there's no place like it," may be sentiment—but here it is no worse for being that.

The holiday excursion steamer. In the production of a holiday film occasional flashes of subjects such as the above give point and variety to the story. The camera can be panned down from the smoking funnel to the crowded deck below.

TAKING pictures . . . or MAKING pictures?

Time was when amateur photography meant 'taking pictures.' If the pictures 'came out,' you had them printed. If not . . . well, it was bad luck.

Nowadays, when they always do come out, the emphasis is on *making* pictures, and wide is the choice of aids to this end. Even when you have made the exposure, you are still only half way to your goal . . . development and the selection of the right kind of paper are as important as lighting and composition. And just as a filter helps to put 'art' into a negative, so is 'Bromesko' an invaluable aid to producing an artistic enlargement—for 'Bromesko' means *rich warm tones* by direct development.

If you have not yet tried 'Bromesko,' get an assorted packet from your Kodak Dealer and treat your favourite negatives to enlargements that are really distinctive. It is as fast, as cheap, and just as easy to use as ordinary Bromide paper.

Write for the Bromesko Booklet to Mr. A. P. Taylor, Dept. 57b,

KODAK LIMITED • KODAK HOUSE • KINGSWAY • LONDON • W.C.2

COLOUR

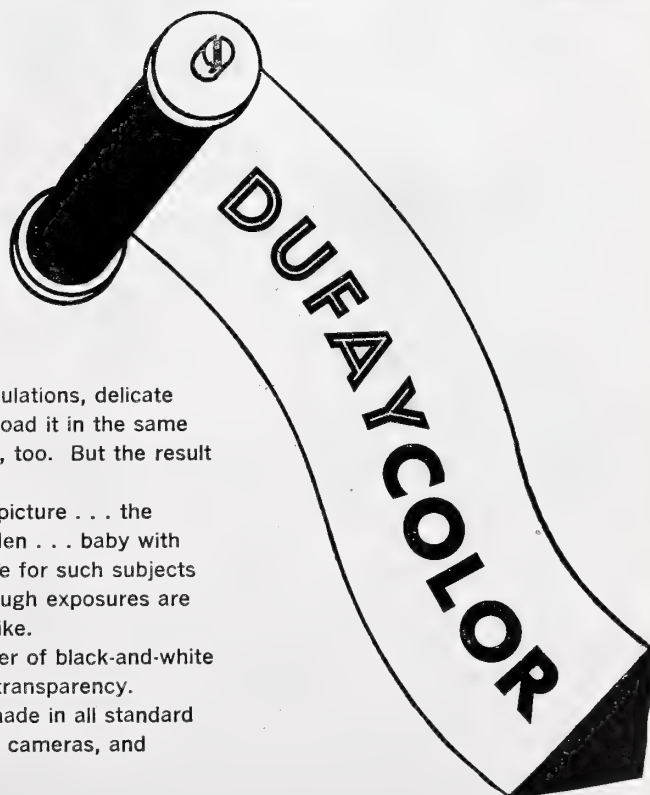

is no longer expensive

No longer does it mean long exposures, intricate calculations, delicate filters. DUFAYCOLOR does away with all that! You load it in the same way as ordinary film. You expose it in the same way, too. But the result is—natural colour!

DUFAYCOLOR puts the glow of life into the simplest picture . . . the picnic-party in the hayfield . . . the roses in your garden . . . baby with his sand-castle. 1/25 sec. at f.8 gives ample exposure for such subjects in the middle of a sunny day—while on dull days, though exposures are naturally longer, results are equally brilliant and life-like.

Your exposed film is developed by us, and any number of black-and-white prints can be made in addition to the original colour transparency.

Buy a DUFAYCOLOR film or pack today! They are made in all standard sizes, including 35 m.m. film for Leica-type miniature cameras, and sub-standard cine film.

DUFAY-CHROMEX LIMITED 14-16 COCKSPUR STREET LONDON S.W.1

PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS.

THIS YEAR USE A REFLEX CAMERA

THE K.W. REFLEX BOX

A light-weight Reflex Camera for standard size $2\frac{1}{4} \times 3\frac{1}{4}$ in. roll film.

A self-erecting focussing hood, in conjunction with a surface silvered mirror and a focussing screen of extra fine grain, allows the entire picture to be examined for sharpness in the brightest light.

The all-metal shutter is adjustable for 1/25th, 1/50th and 1/100th sec., and for Brief and Time exposures. It is connected to the mirror frame, and works with it, entirely free from vibration. Size of picture, $3\frac{1}{2} \times 2\frac{1}{2}$ in.

PRICES :

- No. 905. K.W. Reflex Box, with K.W. f/6.3 focussing anastigmat lens. £3 13 6
 No. 906. Leather Carrying-case, with shoulder sling 12s. 6d.
 No. 908. Supplementary Lens (focus to 18 in.) 10s. 0d.
 No. 910. Optochrom Yellow Filter 11s. 3d.

THE PILOT "6"

Although amazingly inexpensive, the Pilot "6" is a real reflex camera in every sense of the word, and gives you the same working efficiency as much more costly apparatus. It takes 12 exposures $2\frac{1}{2}$ in. square. Shutter speeds: 1/25th, 1/50th and 1/100th sec., also B. and T. Focussing on ground-glass screen with deep hood, a magnifier for fine focussing is provided. Full-size wire frame direct-vision finder for using camera at eye-level. Shoulder strap and wire release. Dimensions: $3 \times 3\frac{1}{2} \times 4$ in. Weight about 22 oz.

PRICES :

- No. 14. Pilot 6, with f/4.5 focussing anastigmat lens £5 5 0
 No. 16. Leather Carrying-case with shoulder sling 10s. 0d.
 No. 18. Optochrom Yellow Filter 11s. 3d.
 No. 20. Supplementary Lens (focus to 18 in.) 12s. 0d.

THE "PILOT 3x4 cm." MINIATURE REFLEX CAMERA

The smallest reflex camera in the world. Combines all the advantages of the reflex with the "pocketability" of the miniature camera. Full-size 3×4 cm. image is seen on focussing screen. Special magnifier in hood for critical focussing. Automatic film exposure counter with indicator from 1 to 16. Also direct-vision view-finder fitted flush with camera side. Takes standard V.P. size roll film.

PRICES :

- No. 41. Pilot Miniature Roll Film Reflex Camera, with Carl Zeiss f/3.5 Tessar lens in Compur shutter, speeds 1 sec. to 1/300th sec. £17 10 0
 No. 39. Ditto, with Carl Zeiss f/2.8 Tessar lens. £20 0 0
 Extra for Rapid Compur Shutter, speeds from 1 to 1/500th sec. £1 5 0
 Optochrom Yellow Filter 10s. 0d.
 Velvet-lined Leather Case. £1 0 0

OBTAINABLE FROM ANY PHOTOGRAPHIC DEALER.

INSTALMENT TERMS

Add 5 per cent (1/- in £) for 12 equal monthly payments. Write for complete price list and instalment order form.

Filming Natural Beauty

By H. EMMETT.

FILMS depicting natural beauty make a strong appeal to a large section of the public.

Occasionally, professional films of this nature are shown at the local ciné theatre and provide a welcome change from the class of film which illustrates the more hectic side of life.

Films such as "London's River" or "Our English Countryside" are examples of this class; they embody nothing more than a series of pictures having for their motive "natural charm and beauty."

We may envy those persons who are in a position to make such films; at the same time there is often sufficient material in our own county or neighbourhood to enable us to produce a first-class film of this type.

Woods, streams, rivers, waterfalls, country lanes, villages or cornfields; these, and other subjects, when thrown upon the ciné screen, can form both entertainment and relaxation for the mind.

A method of making such a film is to commence with a main heading or title, say: "Around the Countryside with a Ciné camera," and then film all kinds of subjects to exist as sub-titles in the main film.

The first series of pictures may be "By the Stream." If so, commence with a general view of the stream from various angles, slowly panoramizing so that we end up each shot with the waters of the stream well composed in the view-finder. If a high-angle view can be obtained so much the better.

Having secured our general view, we can then take a few shots from the banks and water's edge, including reeds or boughs of trees, again from various angles. Each run of film need not exceed seven seconds, and each time the film is started the camera should be slowly panoramed towards some point of interest. It is a good plan, when time permits, to rehearse the "pan" movement before actually filming.

It will be seen that, by this method, the natural beauty of the stream will be fully recorded, and a series of delightful

ciné pictures obtained, all possessing unusual interest and variety.

When filming natural beauty subjects, there should be no hurry to obtain results. Wait for lighting effects; pause to think before starting the camera; walk around and view the subject from different angles; note where the main point of interest lies; wait for clouds to form behind trees or other objects, and, above all, practise the slow and steady panoraming movement of the camera.

Remember also that distant views are never so effective as the close-up and semi-close-up positions. Look for pictures in the swaying branches of trees against the clouds, or in the lapping of water around the reeds. These simple little bits create a special charm and add extra interest to the film.

When making a film of this class, one does not, of course, ignore human interest altogether. Although the object aimed at is the portrayal of natural beauty, yet such pictures as "The hay-cart coming down the country lane," or "The farmer cutting corn," can be filmed and added to the main pictures with effect.

It will be seen that in such a film the subjects are manifold; because of this, great care should be taken to choose only those subjects which lend themselves to photographic rendering.

The main idea in films of this type is to present the various aspects of nature in a form not usually perceived. This is done by filming subjects from unusual angles and under different lighting conditions, so that a new and interesting aspect of beauty is wrested from ordinary simple scenes.

Panchromatic films used in conjunction with a pale yellow filter are essential for good tonal rendering of clouds and foliage, but good results can be obtained on orthochromatic stock.

Films of this class form a welcome change when projected along with sports or other films. Also, they never lose their value; one can show them again and again without any exclamation from the audience about them being "Old news."

Summer-time Projection

By G. E. MOORE.

AT this time of the year the non-movie photographer is certainly "one up on" the ciné enthusiast, for the latter is especially handicapped in viewing his picture.

The extra hours of daylight—and better daylight—entice us all into greater expenditure of film, and we are just as anxious then as at any other time to screen the results soon; there is, naturally, a proportion of ciné photographers who, like so many still-snappers, use their cameras only in the summer months, and they are bound to be eager too.

Yet this is the very time of year when the daylight period is so lengthy, the twilight is longer, and we actually rise and retire one hour sooner during the solar day. If we wait for the shades of night to fall for our projection work there will be late sittings, and our unfortunate children won't see the pictures at all.

True, we can adopt the child's expedient of making a miniature "house" underneath the dining-table by tying old sheets from leg to leg; I have done this on occasion, but (as I need hardly point out) for a youthful and strictly limited gathering of excited enthusiasts.

More comfortable conditions are generally demanded. If, as is often the case, a particular room is always used for projection, much can be done by suitable placing of the screen (with, of course, drawn curtains)—especially by using any recess or wall on either side of the window, or/and arranging a light-shield beside the screen.

One can advise the obvious course of hanging extra coverings over the windows, but, apart from natural difficulties (such as the domestic authorities, and any modern equivalent to the aspidistra), I think that there are better means to our end. There may be a small room with a readily-covered window that can be used. Provided there is no difficulty with regard to electricity supply for the projector there may be a number of suitable places in the domestic premises. It is sad but true that your modern house is not nearly so helpful as an old edifice.

Seek out, then, a dark passage or recess if there is no suitable room; or an outhouse (if free from crawly things or loose lumber that might cause unwelcome diversion); or even a garage, for the bus can be pushed out for the time, and, as garage windows are generally

utterly inadequate, darkness is readily provided (but see that the car has left no oil drippings for your spectators to stand on).

There are a few general points. As a rule, one has not a plenitude of light in the projector; therefore it is a good wheeze to reduce the picture size and thus increase intensity of illumination. It is more than ever necessary to have your thrilled folk immediately in front of the screen if this is at all directional.

On occasion a large open-ended box (such as a packing-case) to act as light-shield for the screen is useful—the screen (which may be a temporary one, such as a large sheet of that very effective material white blotting-paper) being placed inside on the closed vertical end.

In all these situations the object is to prevent as much extraneous light as possible from affecting the picture. This is a simple truism, but it is not so easily followed (or so obvious) as one may think. Final thought: fortunately, screening time at home is generally in the evening (no continuous shows or matinees here), and it may be a beautifully dull day!

The Week's Meetings

Wednesday, July 21st.

Blackpool and Fylde P.S. Lancaster.

Exhibitions and Competitions

CURRENT AND FUTURE.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, July 31. Rules in the issue of June 30.

The Amateur Photographer Novices' Competition.—Special prizes of supplies of films. Latest date for entries, September 30. Particulars below.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.
Nuro Competitions.—Cash prizes every month. Special prizes for boys and girls under sixteen. Full particulars obtainable from any photographic dealer, or from Nuro Ltd., Biggleswade, Bedfordshire.

Isle of Man Sixth Annual Amateur Photographic Competition, £300 cash prizes. Open until September 30. (P. A. Clague, Publicity Department, Isle of Man.)

XVIe Salon International de Photographie de Belgique.—Open, May–October. (M. Julien Lejeune, 70, Av. Van Becelaere, Boitsfort, Brussels.)

Lancaster Art Gallery. Open Photographic Exhibition.—Open, July 10–24. (G. M. Bland, F.S.A. (Curator), Public Library, Market Square, Lancaster.)

Northern Photographic International and Open Exhibition, 1937.—Open, June 19–August 21. (W. Whitehead, 8, Bullyrood Drive, Bradford.)

Eighth Chicago International Salon of Photography.—Open, July 15–September 19. (Alex. J. Krupy, Chicago Camera Club, 137, North Wabash Avenue, Chicago, Illinois, U.S.A.)

XXXIe Salon International d'Art Photographique de Paris.—Open, October 2–17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris (9e).)

I International Exhibition of The Photo-Press and Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Jugoslavia.)

Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Entries, July 30; open, September 11–October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)

46th Toronto Salon of Photography.—Entries, July 31; open, August 27–September 11. (W. H. Hammond, 2, Gould Street, Toronto, Canada.)

3e Internationale Focus Fotosalon, Amsterdam, Holland.—Entries, July 31; open, September 11–26. (Focus, Ltd., Fotosalon, Bloemendaal, Holland.)

London Salon of Photography.—Entries, September 1; open, September 11–October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

First International Competition of Artistic Photographic Pictures, 1937.—Entries, September 1, 1937. ("Camera," Messrs. C. J. Bucher, Ltd. (Publishers), Zürichstrasse, 3/5, Lucerne, Switzerland.)

Fifth Annual Salon, Rockville Centre, N.Y.—Entries, September 1; open, September 11–18. (Dr. M. F. Lee, 74, N. Long Beach Road, Rockville Centre, N.Y.)

Anthracite Salon of Photography, Everhart Museum, Scranton, Penna., U.S.A.—Entries, September 7; open, September 18–October 4. (Salon Director, Everhart Museum, Scranton, Penna., U.S.A.)

The Victorian International Salon.—Entries, September 7; open, October 18–30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Entries, September 20; open, October. (Modern Magyar Fényképezők, VIII, Rákóczi-ut 19, Budapest, Hungary.)

Fourth Canadian International Salon of Photographic Art.—Entries before September 10; open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Sixth Irish Salon of Photography.—Entries, September 25; open, October 30–November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

"Irish Travel" Photographic Competition, 1937. Cash prizes.—Entries, September 30. (The General Manager (Photo Competition), Irish Tourist Association, 14, Upper O'Connell Street, Dublin, I.F.S.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Entries, October 1; open, October 29–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.)

A Prize Competition for Novices

THIS competition is specially for Novices, that is to say, those amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

Our readers who are novices have all the summer in which to make their prints for this competition, and the prizes are worth having.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.
The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.
The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.
Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

The winners of these prizes will thus be encouraged to continue their photographic activities throughout the year with a supply of free film.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor.

The latest date for receiving entries is September 30th. This will give new readers who are Novices, and who intend entering this competition, every opportunity of improving their work during the next three months by reading *The Amateur Photographer* every week and obtaining their competition prints during the summer holidays.

The copyright of all prints entered remains the property of the authors of the photographs, but the right is reserved by "The A.P." to reproduce the winning prints and any others that may be worthy of mention.

The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed as follows: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

Further reference to the competition will be made week by week, and hints given for dealing with the various subjects.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Instructions for processing paper films, together with illustrations of the Lancaster apparatus necessary for the processing, have just been issued in leaflet form by Messrs. Granville Gulliman & Co., Ltd., of Leamington Spa. The leaflet deals with the methods of drying, printing and enlarging from paper negatives, and also gives formulae for negative and print development. A copy of this leaflet may be obtained on application to Messrs. Granville Gulliman & Co., Ltd., at the above address, or at 13, Gray's Inn Road, W.C.1.

The Hounslow Photographic Society, whose first General Meeting was in January this year, will be holding its first Annual Exhibition on September 15th and 16th, 1937, at the Council House, Treaty Road, Hounslow. Any amateur photographers living in the district (Hounslow, Isleworth, Osterley, Spring Grove and Lampton) who are not already members of a photographic society should write to the Secretary, Mr. A. D. Barden, 357, Whitton Dene, Isleworth, Middlesex, who will be pleased to welcome any new members.

Great activity has been shown recently by the Eltham Ciné Society, who have now been actively engaged in film-making for just over two years. Members are now experimenting and working on the problem of synchronising natural sound to the home ciné film, and a satisfactory method has been effected for amateurs. Any amateur cinematographers or societies wishing to make sound films should write to the Hon. Secretary for full particulars, or visit the Studio when shooting is in progress. The Hon. Secretary is Miss V. D. White, 36, Craigton Road, Eltham, S.E.9.

Camera-users who have difficulty in focussing close-ups owing to inability to make sufficiently accurate estimates of distance will find the "Trofi" range-finder invaluable. This little instrument, which is less than 2½ in. long, is a split-field range-finder of base 4.5 cm., graduated for distances from 3 ft. to infinity. On test we found it accurate, and it is much more sensitive than its small size might suggest. At 3 ft. an error of less than 2 in. is very readily detected even with a subject containing no strongly-marked vertical lines. A zero adjustment is provided to allow for resetting the instrument if this should at any time become necessary, and there are shoes of various shapes that can be fixed to the camera, and into which the range-finder can be slipped when desired.

A more elaborate model, the "Karma," offers the convenience of a direct-vision optical finder built into the range-finder casing, which is extended to a length of 3½ in. The finder is large and gives a

brilliant image with well-defined boundaries, the picture-shape being approximately that of the standard V.P. size (4×6.5 cm.). The "Trofi" costs 21s. and the "Karma" 32s. 6d., and both are imported by Mr. R. E. Schneider, of 46, Farringdon Street, E.C.4, to whom application should be made for further particulars.

Messrs. R. F. Hunter Ltd., of 51, Gray's Inn Road, W.C.1, have just published their 1937 catalogue of cameras and accessories. This list deals in considerable detail with the Rolleiflex and Rolleicord miniature twin-lens reflexes, the Heidoscope and Rolleidoscope stereoscopic reflex cameras, and the Purma Special miniature camera. It covers also a very wide range of accessories for photography and cinematography, including the Duto soft-focus attachment, the Tempiphot exposure meter, the Nikor all-metal developing tank, and the well-known Celfix ciné screens. The list may be obtained post free on request from the address given above.

A competition for amateurs for the best cat photographs, either with or without other animals, humans, views, etc., is being organised by "Cats and Kittens," a monthly journal published by Bernard Bartley Ltd., Denmark

House, Denmark Street, W.C.2. Cash prizes of Three Guineas, Two Guineas and One Guinea respectively are offered, and each entry must be accompanied by a photographic competition coupon to be found in the pages of the magazine. The closing date is September 30th.

Mr. Cyril Stuart Woolley, 27, Burford Road, Bickley, Kent, is the latest winner of the Wallace Heaton weekly competition, full particulars of which appear regularly in our advertisement pages each week. The title of the print was "Ann."

The Second Indian International Salon of Photographic Art will be held at the Town Hall, Bombay, promoted by the Camera Pictorialists of Bombay. The last day for receiving entries is the 15th January, 1938, and these, with fees, should be sent to Mr. N. B. Cooper, Hon. Secretary, Camera Pictorialists of Bombay, 53, Nicol Road, Ballard Estate, Bombay, India.

The latest addition to the well-known "N.P. Handbooks," published at 1s. each, is "Camera Lenses and Shutters," by R. M. Fanstone. This little book deals simply with the elementary principles of lenses, the aberrations from which they can suffer, and discusses also the uses of lenses of the various types; and the book winds up with a discussion of the various types of shutters. "Camera Lenses and Shutters" is obtainable from any bookseller or photographic dealer, or post free for 1s. 2d. from The Fountain Press, 19, Cursitor Street, E.C.4.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5×3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½×3½×3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

84. Makers' Formulæ : Developers for Agfa Papers—(2)

Agfa 108. Contrast Developer.

Metol	44 grs.	(5 grm.)
Hydroquinone	53 grs.	(6 grm.)
Sodium sulphite (anhydrous)	350 grs.	(40 grm.)
Potassium carbonate	350 grs.	(40 grm.)
Potassium bromide	18 grs.	(2 grm.)
Water	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take double above quantity.

This developer, which is not diluted before use, gives contrasty results on gaslight, Luxup, Brovira, and Portriga warm-tone paper. At 65° Fahr. develop gaslight and Luxup papers for 1 min., Portriga for 1 to 1½ mins., and Brovira for 1½ to 2 mins.

Agfa 115. Blue-Black Developer.

Metol	18 grs.	(2 grm.)
Hydroquinone	53 grs.	(6 grm.)
Sodium sulphite (anhydrous)	220 grs.	(25 grm.)
Sodium carbonate (anhydrous)	290 grs.	(33 grm.)
Potassium bromide	4½ grs.	(0.5 grm.)
Water up to	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take 440 grs. (50 grm.). If crystallised carbonate is used, take 780 grs. (89 grm.).

The solution may be made up with half the above quantity of water if desired, and diluted before use with its own bulk of water.

This developer gives blue-black tones on gaslight and Luxup paper, the time of development at 65° being 45 secs. It may also be used with Verdex paper, which requires 2 to 2½ mins. development.

Agfa 120. Brown-Tone Developer.

Hydroquinone	210 grs.	(24 grm.)
Sodium sulphite (anhydrous)	525 grs.	(60 grm.)
Potassium carbonate	700 grs.	(80 grm.)
Potassium bromide	18 grs.	(2 grm.)
Water	20 oz.	(1,000 c.c.)

If crystallised sulphite is used, take double the above quantity.

For use, dilute with 2 to 5 times its volume of water according to tone required. Exposure should be 1½ to 3 times that which would be given for normal development in Formula 100.

Time of development for brown-black tones: with Portriga warm-tone paper, 2 to 6 mins.; Luxup Chamois paper, 2 mins.; Brovira, about 5 mins., all at 65° Fahr.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Subscription Rates: United Kingdom £1 1s. 8d., Canada £1 1s. 8d., Other Countries £1 3s. 10d. per ann. post free from the publishers, Dorset House, Stamford Street, London, S.E.1. Telephone: Waterloo 3333. Telegrams: Amaphot, Sedist, London.

Plain Mounting Card.

I wish to obtain some plain card, in sheets about 20x15 in., for mounting prints. The mounts advertised in lists are made for a specified size of print, so I do not know where to turn for plain card mounts. H. M. P. (London.)

Any of the large photographic dealers can supply you with plain cardboard or paper mounts for your own use. If you call, for example, at Messrs. Ensign, Ltd., 88-89, High Holborn, London, W.C.1, they can give you a choice of suitable mounts.

Sensitive Material Abroad.

I am going abroad for my holidays, and hope to visit France, Central Europe, and possibly Russia. Shall I be able to buy in these countries the films and plates to which I am accustomed in England? F. S. (London.)

Generally speaking, you would expect to find on the Continent a preponderance of Continental films. We cannot answer for Russia, but throughout the other countries you mention you will certainly have no difficulty in purchasing any Continental film that is readily obtainable in England. British-made films can be obtained almost anywhere in France and Belgium, but our impression is that they are rather less easily come by in Germany. Kodak films, we think, can be obtained anywhere, as there are associated Kodak companies in nearly every country.

Plates are less used and are more expensive to transport over long distances than films. Except in the larger towns, the only plates you are likely to find are those made locally.

We suggest, therefore, that before you leave England you should expose a spool or two of some film that will be obtainable abroad, and rely on buying supplies as you go. But you should take with you such plates as you are likely to need.

Bad Complexions.

In the enclosed portraits the skin texture is very bad, although both sitters have, in fact, rather good complexions. How can this defect be avoided in future negatives? E. A. C. (London.)

The skin is certainly very bad, particularly in the enlarged print. This is often the result of yellowish patches, which are not usually visible to the eye, but come out too dark on the negative. You do not say what sensitive material you are using, but any panchromatic or even orthochromatic film should give a better result than this, especially if you can manage to use a pale yellow filter. Even then, in some cases, it is necessary to do a little skilful retouching on the negative.

An Extinction Meter.

I recently purchased an extinction meter, and find some difficulty in using it. The instructions tell me to "turn the milled wheel till the faintest discernible number is clearly noted." I find that when one number is dim, but clearly visible, the next can just be read. Which do I take? And for against-the-light subjects should the meter be held closer to the subject than is the camera? J. B. B. (Manchester.)

In handling an exposure meter of any type the main thing is to evolve for yourself some consistent method of use that you can repeat with certainty before every exposure. If, when handled in this way, the meter indicates longer or shorter exposures than you find correct, you are entitled to change the speed number of the film in such a way as to compensate for the constant error in the readings.

In regard to your second query, we can only say that you should always make quite sure that the light entering the meter does not contain too large a proportion of a very brilliant part of the subject, or you will find the exposure indicated insufficient for the shadows.

Spotting Lantern Slides.

How can I spot lantern slides, and what tools and materials shall I need? I use warm-tone plates, and it comes rather expensive to make another slide when spotting would cure a slightly defective one. J. L. (Cheshire.)

We take it that you use the word "spotting" to indicate the retouching of spots on the slides, and not the gumming on of paper discs to indicate the way they should go in the lantern. Spotting, in your sense, is done with a very fine brush charged with water-colour to match the tone of the slide. This work, however, is extremely difficult, and it takes a very considerable degree of skill to do anything of the sort on a slide without the work showing in its magnified form on the screen. As, however, the paint can always be removed by a touch from a damp cloth, it can do no harm to try your hand at the work, and if you are naturally neat-fingered you may acquire the necessary skill quite quickly.

First Steps.

I enclose a negative, the first I have ever developed and also a print from it. As you can see, the result is very poor. Can you tell me what is wrong with the negative that it should yield so poor a print? E. A. T. (Torquay.)

There is nothing the matter with your negative except that it might have been developed just a little longer. It will give a first-rate print or enlargement, provided you select the right paper, in this case a rather vigorous one, and give it the proper exposure and development. The print you send is probably very much over-exposed, and in consequence developed for too short a time. Expose another sheet of paper under the negative, covering it up in successive steps after 2, 4, 8, 16, etc. seconds, and develop this till you are quite sure it will go no darker. One section should be about the right depth; expose now a full sheet for about 10 to 15 per cent longer than this section had. If the grade of paper is correct, this should develop to a first-rate print.

Canadian Speed Ratings.

I have recently bought a photo-electric meter which is graduated in Scheiner speeds. Here in Canada Kodak S.S. Pan. film is rated at 23 degrees Sch., but an imported English film of similar type has 30 degrees Sch. on the box. Exposing, strictly by meter, at this rating gave me almost blank negatives. What is the cause of this? C. P. (Canada.)

Your experience suggests that your meter is graduated in Scheiner speeds according to the American standard, on which a film is allotted a Scheiner number about 6 less than it would be given in Europe. If you subtract 6 from the figure for any English or Continental films that may come into your possession, and then use the meter in the way to which you are accustomed when working with American or Canadian films, you should get negatives up to your usual standard. If you still find under-exposure, it will be because the makers of the particular film you have used are over-optimistic in their speed rating, and you will have to find by experiment what Scheiner figure you have to allot to that particular film for satisfactory results.

WALL'S DICTIONARY OF PHOTOGRAPHY

AND REFERENCE BOOK FOR THE AMATEUR AND PROFESSIONAL PHOTOGRAPHER. Edited and largely re-written by F. J. MORTIMER, Hon. F.R.P.S. Fourteenth Edition Thoroughly Revised.

Cloth Boards

Size $7\frac{1}{2} \times 5$ inches
634 pages

Price 7/6 net

By post 8/-

A complete reference work for the practical photographic worker. It provides useful information in dictionary form on every phase of photography—technical, pictorial, scientific and general, and is in itself an explanatory index to all terms, formulae, etc. All the latest photographic principles are incorporated in the present edition, which includes up-to-date information on all recent developments.

From all leading booksellers, or direct from the publishers

ILIFFE & SONS LTD.

DORSET HOUSE, STAMFORD STREET, LONDON, S.E.1

The London Salon of Photography 1937.

SENDING-IN DAY, Wednesday, September 1st.

THE TWENTY-EIGHTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at the Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 11th September, to 9th October, 1937.

CONDITIONS OF ENTRY.

(Please read carefully.)

1. Pictures must not be framed; but may be mounted or unmounted. Each picture must bear on the back clearly written (a) name of artist; (b) number and title of picture, corresponding to particulars on the Entry Form.
 2. When mounts are used they should conform to the following sizes— 25×20 , 20×16 , or 15×12 ; but no mount to exceed 25×20 ; and it is suggested that white or light-toned mounts be employed. Prints may be of any shape or size, provided they do not exceed the limits of the mounts as given above.
 3. All packages of exhibits from abroad must be clearly marked on the outside: "PHOTOGRAPHS FOR EXHIBITION ONLY—NO COMMERCIAL VALUE—TO BE RETURNED TO SENDER." No prices to be marked on the prints.
 4. Pictures sent unmounted will be suitably mounted by the Salon Committee, and all accepted pictures will be shown under glass.
 5. Pictures must be sent by post or parcels post, packed flat and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.
 6. All pictures for the exhibition must arrive at the above address on or before Wednesday, September 1st. Entries may be delivered by hand at the Gallery on that date only.
 7. The Entry Form for pictures from abroad must be sent SEPARATELY by post, together with entry and packing fee of 5s. (this fee covers any number of pictures from one exhibitor). Exhibitors residing in the British Isles may enclose Entry Form and fees with their pictures.
 8. Pictures sent by post will be repacked in the original wrappings and returned, carriage paid, after the close of the exhibition.
 9. As applications are made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify, in the space provided on the Entry Form, whether they have objection to such permission being given. The copyright in all cases remains the property of the authors of the prints.
 10. The Committee assure intending exhibitors that the greatest care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.
- If pictures are sold a Commission of 15% is payable to the Salon.
The submission of pictures will be understood to imply acceptance of the above conditions.
Notification of acceptance of pictures will be sent out as soon as possible.
A Catalogue will be sent to each exhibitor.

'The difference is truly amazing'

You may think you are getting the best results from your negatives, but are you certain?

Why not remove all doubt by sending your next order to:

**RAINES & CO. (EALING) LTD.
THE STUDIOS EALING, W.5**

Read the following extract from one of the many letters received, and then send along a small trial order.

"The enlargements to hand this morning, for which I thank you.

It is difficult to believe that these pictures are made from the same negatives as previous copies which were done locally, the difference is truly amazing, and you can be sure that you will have all my work in future."

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less 2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 239, Deansgate, Manchester, 3; 28a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

SHEFFIELD PHOTO CO. LTD.

NORFOLK ROW, (FARGATE)

SHEFFIELD — One minute walk from Town Hall

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **ILIFFE & SONS LTD.,** and crossed

Notes being untraceable if lost in transit should not be sent as remittances.

& Co.

IMPORTANT NOTICE

THE VAUXHALL MINICAM

Constructed of Metal—NOT Bakelite.

Everybody, including the Press critics who have seen and tested the new all-metal Vauxhall Minicam, are amazed at the value. This low price is only possible because of the fact that we, as sole distributors, import large numbers direct from the factory in Germany, and, in addition, we are content to sell at a small profit. If you purchase a Vauxhall Minicam you will be saving approximately 50 per cent against the price of its nearest competitor.

2½ square or V.P., f/2.9 anastigmat, Compur shutter. **£6:19:6**

A New Book which will
help you to get the
best results with
your camera

Brighter Photography

by DAVID CHARLES,
F.R.P.S.

This handy book reveals in a clear, attractive way the secrets of successful photography. Though primarily intended for the novice, it is invaluable to every keen camera user.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. Details of the various photographic materials on the market are given, and there are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing.

In addition there are over one hundred and sixty illustrations, each numbered and each conveying a really useful hint. By simple cross references these illustrations provide a series of clear, concise lessons in the art of making better pictures.

Leica

USERS...YOUR OUTFIT IS INCOMPLETE WITHOUT A "TELYT" 20-cm. TELYT LENS

With reflex focussing housing, which opens up new and fascinating fields of photography for the amateur, including: Bird pictures and wild life; long-distance landscapes; sports scenes, cricket, tennis, athletics, horse-racing, etc.; distant buildings; sections of buildings showing fine architectural detail; "close-up" portraits from 10-15 ft. Although the Telyt 20-cm. lens gives you a linear magnification of $\times 4$ over the standard 5-cm. Leica lens, and embodies a ground-glass screen focussing arrangement with $\times 5$ and $\times 30$ magnifiers, it is nevertheless compact and very easily portable.

THE TELYT COSTS ONLY
33/11 a MONTH

for 24 months

ON OUR TWO-YEAR
PAYMENT PLAN

CASH PRICE £37 : 16 : 0

Anyone who compares the bulk of a Leica and the Telyt with a quarter-plate camera equipped with its corresponding lens—about 20 in. focus—will soon decide that the Leica with Telyt represents the most desirable equipment for the amateur contemplating real long-focus work. The Telyt requires no special view-finder; the focussing screen indicates the exact field. Fitted with double wire release.

EVERY LEICA CAMERA & ACCESSORY in stock on EASY PAYMENTS

VIDOM UNIVERSAL VIEW-FINDER

for viewing the field of image given by Leica lenses from 35 to 135 mm. It contains a rectangular image aperture which is enlarged or reduced by means of rotating milled ring. The aperture shows the exact image field corresponding to the focal length to which the index mark on the ring is set. (Chromium finish)

£4 8 0 cash, or 9 monthly payments of 10/3.

"SUNBATHING"

PHOTOGRAPHIC COMPETITION

Just the subject for this time of year. Snap people with the sun blazing down on them—by the seaside—at your local lido—on the banks of a meadow stream. All you've got to remember is that the subject is **sunbathing**—swimming or sea bathing pictures do not come into this category. See what you can do—there's a big cash prize for the best photography during the run of the competition—as well as a weekly prize of 21/-.

FIRST PRIZE £25 CASH!

ANY AMATEUR MAY ENTER, USING HIS OWN CHOICE OF CAMERA & MATERIALS

- The period of this competition is July 1st, 1937, to September 30th, 1937. Amateurs only are eligible. Write your name and address, title of picture, and attach a Wallace Heaton Competition Coupon to the back of each entry. You can use any make of camera or materials and it is immaterial who develops, prints and enlarges your negatives. Entries may be any size, mounted or unmounted (not less than 8x6 unmounted is recommended). All entries to be judged by Wallace Heaton Ltd., whose decision shall be final.
- Wallace Heaton Ltd. have the right to purchase the negative and copyright of any photograph submitted for two guineas, or the right of one reproduction for 10/6. (If a guinea prize-winner for an extra guinea.)
- Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.
- If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made, and no entries will be returned unless above is complied with.

A selection of the best entries will be held back at the close of the competition for exhibition in our galleries prior to their return. Our gallery is always interesting, call and see it when in Town—Free, of course.

YOU MAY WIN THE 21/- WEEKLY PRIZE

Address Your Entries Now, to "Sunbathing" Pictures,

WALLACE HEATON LTD.

127, NEW BOND STREET - - LONDON, W.1

**Brand New
BALDINA
Miniature
Listed £11
WESTMINSTER
Bargain Price
only £7:17:6**

These BALDINA Miniatures are exceptionally attractive little cameras of marked compactness and high precision workmanship. Take 36 pictures on standard 35-mm. daylight-loading cassettes. Automatic counting. Lens is f/2.9 Meyer Trioplan, with Compur shutter to 1/300th, parallax corrected, tubular finder. Entirely unused, as normally issued by the makers with instruction book etc., complete.

● NEW '220' ENSIGN SELFIX

This camera, noted as a pioneer of the self-erecting principle in the inexpensive camera, is now offered in a new form, taking 12 pictures 2½ × 2½ or 16 2½ × 1½ at option. Direct optical finders, adjustable to either size, mechanical film counter similarly adaptable, focusing and depth-of-focus scale and most handsome lustre chromium finish.

F/7.7 Ensign anastigmat. Trichro shutter, speeds 1/25th, 1/50th, 1/100th, T. and B. **£2:15:0**

F/6.3 Ensign and Trichro shutter. As above. **£3:5:0**
12 monthly payments of 5/10.

Ensign f/4.5 anastigmat and Trichro shutter. **£3:15:0**
12 monthly payments of 6/8.

Ensign f/4.5 and Prontor II shutter **£5:15:0**
12 monthly payments of 10/1, 24 of 5/1.

Zeiss Tessar f/4.5 and Compur shutter **£9:15:0**
12 monthly payments of 17/1, 24 of 8/7.

Entirely New Popular Priced ROLLEICORD Model Ia

Gives the usual Rolleicord picture 2½ square (12 on normal 3½ × 2½ spool), and comprises most of the noted Rolleicord features.

With f/4.5 Zeiss Triotar anastigmat, Compur shutter, 1 to 1/300th sec., T. and B., automatic film winding, metal body with leatherette covering

£12:10:0

12 monthly payments of 21/11, 24 of 11/-.

New Zeiss Ikon NETTAR SERIES 510

F/6.3 Nettar, Dervall 3-speed shutter **£3:7:6**

Ditto, Telma delayed-action shutter **£4:0:0**

F/4.5 Nettar, Klio shutter, 1 to 1/175th sec. (side release) **£5:12:6**
Or 12 monthly payments of 9/10.

KINE-EXAKTA

Takes standard 24 × 36 mm. 36-exposure film. Shutter setting and film transport at one winding, speeds 1/1,000th to 1/2 sec. Easily interchangeable lens mount bayonet fitting. Built-in provision for dividing film, allowing separate development of any number of exposures.

With Zeiss Tessar f/2.8

£38:10:0

12 monthly payments of 67/5, 24 of 33/9.

New AGFA KARAT

12 pictures 24 × 36 mm.
(LEICA size) for 1/5

Special f/6.3 anastigmat of very fine quality. Shutter gives speeds of 1/25th, 1/50th, 1/100th and B., carefully designed for simplicity and maximum results. Automatic film wind renders double exposures impossible; easy loading with self-threading. Most efficient and accurate optical finder.

Only **£5:5:0**

12 monthly payments of 9/2.

PLEASE MENTION "THE AMATEUR PHOTOGRAPHER" WHEN CORRESPONDING WITH ADVERTISERS

6 years of experiment culminated in the introduction to the public in February 1937 of the Compass Camera. From that date until April every camera which the factory could produce was sold. Dealers and public alike were clamouring for more cameras than Compass Cameras Ltd. were able to supply.

The Compass Camera represented a break with traditional camera design and required a new production technique. So in spite of the years of development work and exhaustive testing a great deal was learned during the first three months of marketing—both about the reaction of the public to the camera and the reaction of the camera to the handling it received.

It would have been easy and economical to take the various improvements and alterations and incorporate them one by one in future cameras as opportunity presented itself. But it was decided to adopt a more drastic and effective—though far more expensive—course. Production of the original models of the camera was stopped. After most careful consideration it was decided that certain modifications and additions would enhance the value of the camera. The fundamental design of the camera remained unaltered; but a new Lens was fitted. Only a slight modification of the original formula had been made, but it resulted in notably finer definition

and better covering power. The mechanism of the Shutter was slightly altered to give even greater reliability, while a new mounting was designed for the Range-Finder to insulate its delicate adjustments from shocks.

Further, some slight but important alterations were made in the camera back which, together with an improved method of loading the sensitive plates into the Compass Envelopes, ensured that the Envelopes should work smoothly in the camera. The back has also been adapted to take a roll-film attachment, which is now available.

Both dealers and public await deliveries of the Compass with impatience, but because Service is the basis of their policy, Compass Cameras Ltd. have given their first thought to purchasers of the original model of the camera. The Company is anxious that they should enjoy the benefit of these improvements.

They therefore offer the owner of any original Compass, which does not embody these improvements, one of the revised series in free exchange for it.

The exchange can be effected either through the Dealer from whom the original camera was bought, or direct with Compass Cameras Ltd.

*Revised Model Compass
Cameras are now available
for exchange and purchase.*

No Further Comment Needed!

Dear Sirs,

I cannot tell you how much I appreciate the Rolleiflex—it is indeed the finest camera that I ever touched.

There is not one bad print out of all the exposures and many of them I would not dare to attempt with any other camera. It makes photography a pleasure instead of the dare-I-take-it, do-you-think-it-will-come-out dread, it makes the amateur a professional, and the ground-glass screen makes it impossible to take a bad picture.

You will find enclosed guarantee slip, I am sorry I have not sent it before, but I was so enthralled with this wonderful camera.

Signed (B. R.)

Rolleiflex

Takes 12 pictures on 3½×2½ roll film for 1/-. Can be adapted for plates or 35-mm. miniature film. Fitted with Compur Rap'd shutter speeded to 1/500th sec., T. and B., and 1/3.5 Zeiss Tessar lens £25 0 0

THE NIKOR

ANTI-FOG DEVELOPING TANK

for ROLL FILMS

It is noteworthy that copper (in brass, nickel-silver) and tin (in solder) exert a strong fogging tendency in developing solutions.

THE NIKOR anti-fog developing tank for roll film has been designed to overcome this difficulty and still retain the many advantages of a metal tank. It is made entirely of the best grade of stainless steel. Solder is eliminated by means of welding. These two features remove the slightest possibility of metallic chemical fog. It is an apparatus of most modern construction, offering exceptional ease in operation and perfection in results.

RAPID DAYLIGHT FILLING • QUICKLY CLEANED • FREE CIRCULATION

GAYVERT

(Regular)

The emulsion has full orthochromatic properties and possesses great latitude. It is very fast and gives excellent results for all ordinary snapshot work. Available in all popular sizes from dealers everywhere.

Interesting and fully
descriptive list will
be sent post free on
application.

SUPERCHROM

(Express)

has a speed of no less than 28° Sch. and is highly orthochromatic. It has exceptional exposure latitude and an anti-halation backing. Ideal for difficult conditions and speed subjects. Available for most cameras.

with
a new

Rolleicord

MODEL 1A

That's all it costs to buy one of these popular twin-lens reflexes at Wallace Heaton's. Why not get yours now and be prepared for a holiday season of photography at its best? Landscapes, indoor snaps, speed subjects, are a few of the things you can take better with a Rolleicord. Rolleicord 1A is the biggest value to-day in twin-lens roll-film reflexes. Takes 12 pictures on $3\frac{1}{2} \times 2\frac{1}{2}$ roll film for 1/-, shows the picture full size and right way up on the ground-glass screen. Easy to use, easy to get dead-sharp focussing. Built to the well-known "Rollei" standard. Can be adapted for plates and ciné film and takes all Rolleiflex accessories except the angle mirror. Has art leather-covered body. Fitted with f/4.5 Zeiss Triotar lens and Compur shutter, speeded to 1/300th sec., T. & B.

Cash price **£12 : 10 : 0**

11/3 A MONTH FOR 24 MONTHS

HAVE YOU SEEN THE NEW

Agfa Karat

IT TAKES 12 EXPOSURES
24×36 mm. ON 35-mm. FILM FOR 1/5

This camera has the features and performance of a camera costing much more than its price of **£5 5 0**. The 12-exposure cassette loading is definitely more convenient, especially as a new cassette can be loaded within 10 secs. It is a sturdy camera encased in a light alloy body with special non-scratch black covering. Clear and accurate direct-vision optical finder, shutter speeds 1/25th, 1/50th, 1/100th, T. and B. The camera will only operate when all the normal movements have been made; this guarantees no double exposures. The release is automatically locked when camera is in closed position—no accidental exposures. The lens panel snaps open into position on the touch of a button. This camera opens up the way to real miniature photography for the photographer whose taste has hitherto been in advance of his means.

Enlargements from Karat negatives, $3\frac{1}{2} \times 2\frac{1}{2}$ 2/- dozen. Strip prints 2/6 for 36, or film positives 5/- for 36.

Very generous exchange allowances.

ACTUAL SIZE OF PRINT

ROBOT

"THE CAMERA THAT THINKS FOR YOU"

WHY?

- Shoots sequence pictures with machine-gun speed.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focussing gives needle-sharp definition and supersedes range-finders.
- Takes up to 50 exposures on standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan" to colour film at any moment.
- With motor wound, takes from one up to 24 exposures in quick succession or singly.

WHY?

- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives Time and from 1 sec. to 1/500th sec., and all intermediate speeds.
- Weighs 14 oz. Just heavy enough to be held comfortably without risk of movement.
- Overall size only 4½ x 2½ x 2 in.
- Three view-finders in one, including "right-angle" for "candid" work.
- Daylight loading spools available.
- Camera has stainless steel body covered black morocco.
- Interchangeable lenses.

CINÉ-KODAK '8.'

4d.
A DAY

OUTLAY SPREAD
OVER 2 YEARS
OR £10 CASH.

It's more fun taking movies!

WITH THE CINÉ-KODAK '8'

This year at very little expense you can bring back from your holiday reels of life and laughter. Holidays call for a movie camera—there's so much action, so much fun and colour that only a movie camera can possibly do justice to it.

It's quite a mistake to think that you can't afford to run a movie camera—you can. For 4d. a day—on Wallace Heaton's Easy Payments you can own a Ciné-Kodak '8.'

And film costs are down to a minimum too. A roll of Ciné-Kodak pan. film costs only 10/-, including processing and return postage. This roll will give you 20 different scenes, each as long as the average news-reel shot, for as little as 6d. a scene.

Having a photographer's trained eye you'll be able still further to economise in film by concentrating only on those shots which you know will look best on the screen.

This year, instead of prowling off on your own in search of landscapes with a still camera, stay with the family and film them. What tremendous fun next winter—but now is the time to get your Ciné-Kodak '8.'

Your present apparatus taken in part exchange—our allowances are the most generous in the trade.

Wallace Heaton

The holder of this coupon is guaranteed by me to have the Ciné-Kodak 8 expertly demonstrated.

If out of town post this with your name and address and I will gladly forward full descriptive literature.

Vol. LXXXIV. No. 2542.

SUNSHINE is the dominant factor that will impose itself most definitely on outdoor photography during the next few weeks. No matter whether the August holiday-maker is at the seaside, on the river, in the country or up in the hills, it will play a part that cannot be ignored in the pictorial efforts of every amateur. How to render it to the best advantage will be the problem. From the general quality of the entries in recent "A.P." Competitions and many others that we have had an opportunity of seeing there is a steadily growing appreciation both of this factor and of colour values, fostered, we feel sure, by the increasing use of panchromatic films and colour filters. The old "dread" of using fast colour-sensitive material is vanishing and the result is a higher standard of work all round, even with beginners. The amateur photographer who would succeed in the treatment of sunlit and brilliant subjects should feel confident that modern sensitive material will render them adequately if they are tackled boldly; but beware of over-exposure—especially at the seaside.

Colour Sensation.

We are not surprised to hear that colour on the commercial films is following the same evolution as colour photography did in the hands of the amateur. In other words, after the first riotous splash, it is finding its feet in shallower waters. The early colour pictures produced for the theatres were mostly interior scenes in which the brightest parts of the spectrum were lavishly employed. The ballroom made the spectator dizzy with its flaunting colours. The spectator gasped and

TOPICS of the Week

A JOLLY SEASIDE SNAPSHOT—
but one that could have been spoilt very easily by over-exposure. Brilliant sunshine and white spray call for a very short exposure, a small stop in the lens and a lens hood, while pan. film preserves the tonal qualities of the rocks, figures, and water.

sat back, but afterwards, the sensation of to-day being the merest commonplace of to-morrow, he thought nothing of it. Now it has been discovered, as colour photographers with screen plate processes had already found, that nature stands the colour test better than the artifices of man. After all, she has been at work on colour for a good many thousand years, before Technicolor and Kodachrome came along, and where colour pictures are in evidence—apart from the comic strips which belong to a different category—they are more often low in tone. The colour in a quiet landscape, a dull forest, even a barren desert, has been found to have its value. It is just the same as it was with colour photography. Proud in their possession of something which would record the most vivid colours in their gardens, the early workers concentrated on such subjects, only to find later the value of the relatively colourless.

Malice in the Camera.

Mr. J. B. Priestley in a recent essay says that there is malice in the camera. There is a sinister cast, he says, to the magic mirror we have devised. He agrees that it is amazing that a visiting friend, merely by pointing a black box at us, and making something click, should be able to catch and retain our fleeting images, pluck out one moment from the flux, so that people unborn may possibly see the light and shadow that was on our faces one summer morning. But what they see, he adds, will be no true record, it will be a cold libel. That demure servant the camera will have the last laugh. It may be so, and yet from the assembly of photographs of this generation the next will have a

pretty clear picture of us. We are a little impatient of this depreciation of the photographic mechanism. It is an old gibe that the camera lies. In fact, it does not lie. It tells the truth in a way that is an example to all other recording agencies. It is the truest thing we have. Don't we wish we had photographs of the people and things that existed before the photographic era got started? They would correct a world of false notions. The camera with all its faults and occasional distortions has mightily served the cause of truth.

Photo-surveying in the High Alps.

A photographic survey of Switzerland is being undertaken, which it is expected will take twelve or fifteen years. One outstanding difficulty which the field parties are experiencing is the pine forests. These forests are so opaque that the contours cannot be taken. In the case of deciduous forests enough ground can be seen in air photographs to enable contouring to be carried through the trees; should

this not be the case in summer, photography can be carried out in the late spring, before the snow is completely melted. But the pine forest is intractable to any method of photo-survey. The photographs are being taken on glass plates of 10×15 cm., coated with a special German emulsion. The camera has a lens of fixed aperture, $f/12$, to which a four-times filter is attached. The plates are very slow, and permit all exposures to be made with a lens cap.

Carbonate of Soda.

As was to be expected, Mr. Kressman's letter giving his analysis of washing soda ("A.P." July 14th, page 51) has created considerable interest and has brought comment from other readers, many being surprised to know that a sample of washing soda could contain as much as 98.3 per cent of "sodium carbonate crystals" specified in photographic formulæ. One correspondent remarks that it was a happy day (in January, 1891) for amateur photographers when they were told by a leading firm of plate-makers

that sodium carbonate might be used as an accelerator in place of ammonia, and a yet happier day (in May, 1892) when the plate-makers put a pyro-soda developer formula on their plate boxes in place of the pyro-ammonia advocated by the firm for twelve years. The primary note told the amateur to use "soda carbonate crystals, not bicarbonate," but nothing was said about washing soda. In recommending soda the firm's circular said: "It does away with ammonia fumes, so objectionable to some photographers, and it will allow more forcing in cases of under-exposure without fear of fog." Many photographers very soon made a practice of using washing soda, "an impure form of carbonate," in place of the purer crystals, and many have continued to do so. As a matter of fact (continues our correspondent) the washing soda of to-day, as a whole, is a very much purer and cleaner product than that which our grandparents knew, and the best makes, sold in 2-lb. cartons at twopence, seem to serve as a developer alkali very well indeed.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Camera for Enlarging.

Will you tell me how I can arrange to use my $3\frac{1}{4} \times 2\frac{1}{4}$ camera as part of an enlarger? How can I find the right distances for different-sized enlargements? E. L. (Dundee.)

Of the thousands of questions that reach us there is no more frequent one than a request for details (and even drawings) of the construction of an enlarger of which a camera (often unspecified) is to form a component part. It is quite possible to use some cameras as parts of some enlargers, but even in comparatively simple and straightforward cases, and when all the necessary facts are known, the matter cannot be dealt with in the form of a reply to a question.

For the benefit, we hope, of others besides yourself, we will mention one or two fundamental facts.

The distances from lens to negative and from lens to paper bear a definite relation to each other, and are called conjugate foci. To find them, the focal length of the lens must be known, and the measurements must be made from a point which, in the case of a compound lens, may be at about the position of the diaphragm. Anyhow, the distances are adjusted finally by trial, and not by measurement.

Approximate distances can be found as follows. If the print is to be twice the length of the negative, that is enlarging two diameters; if the print is to be five times as long as the negative, that is five diameters; and so on. To the number of diameters add 1, and multiply by the focal length of the lens. This gives the distance from lens to paper. When this distance is found, divide it by the number of diameters, and you have the distance from lens to negative.

Suppose your lens is of 4-in. focus, and you want to enlarge

3 diameters; then $3+1$ multiplied by 4 is 16 in., which will be the distance from lens to paper; and 16 divided by 3 is $5\frac{1}{3}$ in., which will be the distance from lens to negative.

If you know the focal length of your lens you can soon work out a list of pairs of distances for all the sizes of enlargement you require. It will probably be easy to provide the necessary spaces from lens to paper; but the vital question is, can you fix your lens at all the required lens-negative distances?

You will see that this necessity rules out all fixed-focus cameras, and all in which the lens has a focussing mount, or is focussed by revolving the front cell. Even when the front of the camera is movable you may have difficulty. For example, a 4-in. lens must be 6 in. from the negative to give a two-diameter enlargement, and it may not rack out as far.

Then comes the inevitable problem of even illumination of the negative. For this you must have some suitable type of illuminant, and a practically light-tight, ventilated heat-proof lamphouse. For small negatives, say not larger than $3\frac{1}{4} \times 2\frac{1}{4}$, you can get even illumination with a sufficiently large light at a suitable distance from a sheet of ground glass interposed between it and the negative.

If you improve the illumination by using a condenser, new problems arise. There must be an approximate correspondence between the focal lengths of condenser and lens, and you must be able to vary the distance of the light from the condenser according to the different positions of the lens.

In addition there are the many constructional details, which vary for vertical and horizontal types. Many photographers can, and do, overcome all the difficulties, and make quite serviceable enlargers; but this is only when they understand the fundamental principles involved in such apparatus,

What to take on Holiday

In the following article some advice is given as to what the amateur photographer should take on holiday. It shows the wisdom of anticipating possible requirements.

WE are already meeting people who regretfully admit they have had their annual holiday. But with the true spirit of helpfulness that is characteristic of amateur photographers they are always ready to tell others, who yet have their holidays to come, some of the photographic troubles they have encountered and what they would do if they had the opportunity of a further holiday.

For that large number of readers, therefore, who are still looking forward to their holidays in August and September, there are many points worthy of attention while there is yet time.

In the midst of holiday preparations, for instance, it is well for the photographer to devote a little more consideration to the subject of equipment than is usually given. Many workers devote too little attention to this subject, with the result that when away from home they sigh in vain for some part of their outfit that is miles out of reach.

Cameras.

It goes almost without saying that most amateur photographers will take a small camera with them, possibly a miniature, and decide to rely upon this. While such a camera will, in the hands of an experienced worker, serve for a great range of subjects, there may be others which, if not outside the range of the outfit, could be more easily taken with a larger instrument, or one of different type possessing movements not found on the small film camera or the miniature.

It is almost impossible, if the photographer is new to a district, to determine beforehand exactly what is the best outfit, or to anticipate requirements in the matter of apparatus.

Of course, if he is proposing to restrict his work to beach snapshots and similar efforts there is no more to be said. Practically any type of camera will serve this purpose. If, however, he is seriously considering "working" the new district for picture-making purposes it is a different matter.

It is suggested that if the amateur has a choice of equipment, he should take with him, not necessarily for constant use, a small folding camera for plates or film packs and fitted with a rise of front.

In these days of miniature cameras it is possible to purchase a serviceable outfit of this type for very little. Large apertures will not be needed, nor will the photographer want a large number of plate-holders. Such a camera, loaded with fast panchromatic material, will be found of great value for subjects which necessitate careful composition and possibly a rise of front.

If the photographer possesses such a camera, yet does not wish to burden himself with it, we may suggest that it is left at home, but packed ready for dispatch by post should it be necessary.

Accessories.

The photographer on holiday will not wish to burden himself with a large number of accessories. It will be wise to take a light folding tripod. This takes but little room and does not weigh a great deal, while it may be packed amongst clothing. There will probably be found subjects which will give better negatives if photographed with a little more exposure, and possibly a smaller stop.

One or two colour filters will be necessary if the photographer is to get the best results with colour-sensitive material, and especially with regard to clouds.

Exposure Meters.

There is one item in his equipment that the wise photographer will consider as necessary as the camera itself. It is some form of exposure meter. No matter how experienced the photographer may be, it is very necessary, when photographing fresh subjects, and under strange lighting conditions, to use some reliable means of exposure calculation. And the exposure meter should be one with which the worker is familiar.

There is a personal factor to be considered with every one of these meters, and if the photographer decides upon a new one, it is well to get the instrument and to understand its working before taking it away for use where it is impossible to repeat exposure. The amateur has been repeatedly warned against taking a new and untried camera upon holiday before getting entirely familiar with it. The same applies to the exposure meter.

The photographer will do well to keep records of exposures made on holiday so that he will know the subjects that the exposed spools or film packs contain. This is of assistance when it is found that negatives have been over-exposed, so that careful development may be given to the others that it is expected will have had similar treatment.

After the holiday is over and the exposures are being developed it is not always possible to locate the place where they were taken from memory. For this reason alone an exposure record helps. Local data should also be secured wherever possible.

Other Items.

Other accessories which should be taken include supplementary lenses, which are useful for special subjects; a portrait attachment has uses in this connection other than its name implies.

If the camera focusses by scale and finder one of the coiled steel rules which may now be bought at most dealers and stores is useful for ensuring that the camera is at the exact distance. Failing this, an ordinary long tape measure can be carried.

While it is not likely that the photographer will wish to spend time developing holiday exposures, it is a good plan, if space will permit, to take a developing tank so that one or two films may be developed. This will serve as an indication that exposures are correct, and that the apparatus is working satisfactorily.

Developing Trial Exposures.

The experienced worker will develop one or two exposures for the sake of being certain, and he may have this done locally by a D. & P. firm. A modern developing tank, and developer and fixing salt in dry form take up but little room, however, and it can easily be operated in one's room at night with the blinds drawn.

While there is yet time the amateur who has not already tried it should develop a trial spool at home under holiday conditions.

Finally, it is suggested that a list of "things to take" should be prepared beforehand. This will ensure that no important item is left out at the moment of packing, and it will also serve as a check that nothing is left behind when returning.

July 28th, 1937

STOP

By
CLARENCE PONTING

POLPERRO HARBOUR, CORNWALL. 'Chrome film, 1/50th, f/8.
Dull. No filter.

THE inland photographer who spends his annual holiday at the seaside is going to have trouble in estimating the correct exposures, which will be quite different from those to which he is accustomed. At least, that was what I found during the first few days of my visit to the Cornish coast. And so, after having exposed and developed twelve rolls of film on a variety of subjects, I write these notes—whilst the difficulties I met with are fresh in my mind—in the hope that they may be helpful to those who have not yet had their holidays.

In the first place, I found the intense light was causing me some difficulty in estimating the correct shutter speed, particularly as I was using a 2× filter to retain the clouds and relative colour of the brilliant blue sea. A photo-electric or extinction meter would have overcome this difficulty, for it is not easy to determine the intensity of the light under variable weather conditions.

SAND CASTLES with children make effective groups. No filter is required. 'Chrome film, 1/50th, f/11.

ST. IVES. 'Chrome film, 1/50th, f/11. No filter. Bright light.

material. They were all equally good when correctly exposed, so far as colour rendering and retention of clouds were concerned. I did find the usual shilling $3\frac{1}{4} \times 2\frac{1}{4}$ orthochromatic film rather slow when used with a filter, and this type had not the latitude found in the double-coated 'chrome and panchromatic variety.

Inland, I use the ultra-fast 'chrome type of film, and rather wondered if this would be too rapid for the seaside where light is superabundant. But with a 2× filter in use this type of film gave me the best results; 1/100th sec. at f/11 resulted in well-exposed negatives, when the sun was shining unobscured in June. With the sun shining through light clouds, 1/50th second at the same stop proved correct.

The use of a filter is almost imperative if the sea is to be rendered in its correct tone, and all clouds retained of a printing density. I tried one roll of 'chrome film without the filter, but found the clouds were nothing like so well retained, although the rest of the picture

PRESS

from the SEASIDE

was quite satisfactory. My advice is to keep a $2\times$ filter permanently on the lens whilst at the seaside, unless subjects away from the sea are to be made. The quaint streets require very much the same exposure as similar subjects inland. I also found that when taking subjects which

"OVER SHE GOES," 'Chrome film,' $1/3000$ th, $f/6.5$. Sun. No filter.

included dark rocks, it was better to omit the filter.

Shall one use panchromatic films for beach work? I should say yes, if the worker is used to them, for there is a slight improvement in the colour rendering, and they are faster when used with a filter; but if you have been used to the 'chrome film, use it exclusively. Given the correct exposure it will retain the clouds and give almost perfect colour rendering. It is quite fast enough for all beach work when used with a $2\times$ filter, and if high-speed shutter exposures have to be made it will cope with these if the filter is removed. The user of a cheap camera will also benefit by using this fast film, for even his small aperture will give correct exposures with a filter in position, which would be impossible inland. The owner of a super camera is likely to over-expose 'chrome film, but the double-coating and anti-halation backing will rectify this.

CARTING SAND. Open beach subjects can be correctly rendered on 'chrome film' and $2\times$ filter with $1/1000$ th at $f/11$.

ST. IVES. Seaside street scenes require normal inland exposures. 'Chrome film, $1/250$ th, $f/6.3$.

Seaside subjects depend entirely upon the retention of all the subtle tones met with in sky, sand and water. These can only be obtained by the use of a light-filter and correct exposure. For all these open beach subjects I found a

development time of four minutes gave good printing negatives with a normal metol-hydroquinone developer diluted with an equal quantity of water. When exposing upon scenes in which dark rocks are in the foreground, failure will result unless the shutter speed is calculated to give detail in the rocks. The exposure tables cover this type of scene.

I was fortunate in having the sun shining during most of my holiday, for I made a few exposures when the sky was overcast, but the results were poor in quality in comparison with those when the sun was shining brilliantly. In fact, except for figure subjects, I think I would save my films for a sunny day next time I visit the sea.

EAST LOOE HARBOUR, CORNWALL. This type of scene requires an exposure for the near foreground. 'Chrome film, $1/500$ th, $f/8$. No filter.

Readers' Hints, Tips and Gadgets

TETHER YOUR LENS-CAP.

A LENS-CAP is generally taken off in a hurry and hastily put—where? Every photographer whose camera is so designed that the lens is exposed must have had the experience of hunting through his many pockets for the lens-cap, only to find it at last covered with dust, fluff, or shreds of tobacco. It is worth while to tether it in such a way that when taken off the lens the cap only has to be dropped—to swing securely on the end of a piece of cord.

If you drill a hole—or have it drilled—near the edge of the cap, it is easy to fix a length of black silk cord to it by threading the cord through the hole and knotting it on the inside. The hole should *not* be in the middle, as the front glass of a lens is always convex; there is therefore more space for the knot at a point just within the edge of the mount.

The other end of the cord can be secured to any convenient part of the camera. If an ever-ready case is used, it is a good plan to fix the free end of the cord to a visiting card. This can be held simply by putting it into the case below the camera, which will hold it tightly when the fixing-screw is done up. As the sketch shows, the cap will hang inside the lid of the case when the camera is in use.

W. S. KIRBY.

USING EMPTY FILM-SPOOLS.

D ISCARDED wooden film-spools can be turned to very good account as clips by which to hang up prints or films on a line to dry. For this the slit in the spool is used to hold the print, and the metal end is employed as a tightening-band to close the slit on the print.

To make a clip, first pull off the metal flange at the slotted end of the spool. Next cut through the wooden shank at the level of the end of the slot, as indicated in the sketch. Now try to slide the flange that has been removed over the shortened spool. In all probability it will be a very tight fit indeed; the end of the shank is therefore whittled or sandpapered down until the flange will pass over at least $\frac{1}{4}$ in. of it without closing the slit. If now the edge or corner of a print is slipped into the slit this can be closed, and so made to grip the print by pushing up the flange farther along the shank.

All that is required to complete the clip is to provide some means for hanging it up on a line or other support. This is most readily done by screwing a small screw-hook into the unaltered end of the spool, relying on the flange there to prevent the wood from splitting. If there is not enough wood to take the screw, a small plug can be made and slipped into the hole; it need not be glued, for screwing the eye into it will spread it sufficiently to prevent it coming out, except under a pull many times greater than the weight of the spool and print.

F. DOUGHTY.

NEO-COCCIN RETOUCHING.

NEO-COCCIN, or New Coccine, seems to be little known to keen amateurs, yet it is easy to use, increases density without making any part opaque, and can easily be washed off partially or totally.

Bought in powder form from any good photographic chemist, a tiny tube lasts for years, since only a few specks dissolved in water are needed at a time, the colour being built up to the required density in several washes, graduated from the

merest tint of pink. It is a good tip to test the negative at different stages, since it is very easy to over-estimate the amount of retouching necessary, and while it is simple to wash off the colour in plain water, it is easier still not to exceed the amount required in the first instance. Use a very fine brush, not too full.

Neo-coccin may be applied to a whole background which is too dark, or to parts only, or it may be used to liven

up high-lights which have become clogged. Attractive softness of outline may be obtained by careful overlapping of different strengths of wash or, where desirable, the outline may be rigidly followed in order to obtain a clear demarcation between tones. It is advisable to avoid heavy blobs of colour.

In addition to its value as a retouching medium, neo-coccin protects the negative from surface scratches, fingerprints, etc.

E. M. BARRAND.

LONDON RIVER

feels its ebb tides and its flood tides; neaps or springs, they are always there! Boats slide up the reaches on the flood, and others go down to the sea on the ebb. But, except for an hour or so on each tide, there is only one tide at a time in the river.

'Tis different with us! There is a constant flood in, and a constant ebb out, of used cameras, with just a little dead water where our reconditioning department makes the cameras look like new. Why not let your camera float to us on the flood, and collect the camera of your choice on the ebb? If required, it can be borne down-river to you on a hire-purchase agreement, and we can assure you that our part-exchange and hire-purchase facilities are quite matchless. "Try 202 for Service!"

LEICAS :

SPECIAL OFFER.

Four only, IIIa Leicas, fitted f/2 Summar lenses, complete with ever-ready cases, purchased by us from H.M. Customs, and guaranteed unused£37 10 0

THE NEW S.S. DOLLY

Have you ever handled a Super-Sport Dolly? Without the range-finder they are really superb cameras, and have long been the favourites of many discriminating miniaturists, but now that they have been fitted with coupled range-finders we can safely prophesy a great future for them. We incline more towards the Model C than to the A, since the capacity of the former to take plates, as well as roll films, and its ability to use interchangeable lenses, appeals strongly to us, but for the worker who uses only roll film, and needs only a standard lens, the Model A is the ideal camera.

Prices range from £5 17 6 to £12 16 0 for the Model A, and from £9 9 0 to £16 12 6 for the Model C.

Hire purchase facilities for all periods up to 24 months.

ROBOT 48 Pictures—2 Shutter Winds

There is no camera on the present-day market against which the Robot can be compared. It definitely stands in a class of its own; no other camera is so rapid in action, and we have yet to meet a camera turning out better work. We should be delighted to demonstrate the camera, or to give any information regarding it.

Prices: With f/2.8 Tessar £29 10 0
With f/3.5 Tessar£26 10 0
With f/3.5 Primotar.....£23 10 0

Hire purchase facilities for all periods up to 24 months.

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1
(HOLBORN 4789.)

(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

**IMPORTANT**

If you purchase a Zeiss Ikon Camera fitted with a Compur Shutter, or over £10 in value, ask your dealer for the Zeiss Ikon approved three years' guarantee. This guarantee only applies to cameras purchased in Great Britain and Ireland.

Do you know what this is?

Our illustration shows the back-sight of the optical direct-vision view-finder on the new Zeiss Ikon Ikonta for 12 pictures $2\frac{1}{4}'' \times 2\frac{1}{4}''$ on the usual $3\frac{1}{4}'' \times 2\frac{1}{4}''$ spool. This finder springs open ready for use simultaneously with the camera, on the pressure of a button. The illustration also shows the built-in shutter release on the camera body, which enables the camera to be held steadily while making exposures. Another feature indicative of the attention to detail to be found in all Zeiss Ikon instruments is the ingenious sliding cover to the safety window for pan. film.

The Ikonta is provided with the special 2-point setting of focus and stop, so that all pictures taken out of doors with $1/25$ th second exposure are sharp for distances over about 10 ft. The Ikonta can also be obtained for $2\frac{1}{4}'' \times 1\frac{3}{4}''$, $3\frac{1}{4}'' \times 2\frac{1}{4}''$ and $4\frac{1}{4}'' \times 2\frac{1}{2}''$ pictures.

IKONTA NEW MODEL

FOR $2\frac{1}{4}'' \times 2\frac{1}{4}''$ PICTURES

With Novar f/4.5 and Telma shutter (to $1/125$ th sec.).....	£6 12 6
With Novar f/4.5 and Klio OO shutter (to $1/175$ th sec.).....	£7 5 0
With Novar f/3.5 and Compur OO shutter (to $1/300$ th sec.)	£9 10 0
With Tessar f/3.5 and Compur OOR shutter (to $1/500$ th sec.).....	£13 0 0

ZEISS IKON LTD., 11, Mortimer House, Mortimer Street, London, W.1

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

With Children in the Country

By W. JENKINS.

THE summer holiday is to a very large extent the children's festival, and there is much to be said for the point of view that a holiday, like Christmas, is wasted if there are no children to enjoy it. "Happy snaps" of children on the beach are taken in their thousands, but a holiday spent in the country does not seem to bring the cameras out of their cases to anything like the same extent. Yet a country walk, especially on a day of breeze, intermittent sunshine, and fleecy clouds, can produce a splendid "bag" of child photographs. The backgrounds and the lighting of the countryside are, on the whole, far more attractive pictorially than those of the seaside.

In the country, either foliage or the sky can be used as background, but in the former case care must be exercised that the lighting of the foliage is even. The side-lighting of Fig. 1 has the disastrous effect

Yet to the eye, misled by colour and movement, the background seemed completely subsidiary to them.

Fig. 2, in which the children are seen against the sky, is far more satisfactory. Here the lines of the landscape are so simple that it becomes what it should be, a mere setting for the figures. But it should be noted that without the clouds, and the deep filter necessary to render them, the setting would have lost most of its attractiveness.

Fig. 3 is a photograph of rather different type—a record of an activity rather than just a portrait group. One of the favourite occupations of these

Fig. 2. With clouds as a background, the figures stand out as they should.

tables. The negatives aimed at are those suitable for enlargement on a medium grade of bromide paper. This allows a margin of error on either side to cope with contrasty and flat subjects, for which soft and vigorous papers respectively are used.

The camera is used chiefly as means of recording the activities and progress of the "youngsters," and I find the lens aperture large enough to soften the background when necessary, yet the "depth of focus" is so great as to make focussing easy.

Fig. 3. WATCHING TRAINS.

two is watching trains go by, especially from such a vantage-point as the wire fence shown here.

In Fig. 4 there is again a back view of the pair, and their attitudes as they walk along are very eloquent of the subdued and confidential humour that is sometimes produced by the atmosphere of a Sunday afternoon.

All these photographs were taken with a 6×6 cm. camera (a "Brilliant") with an f/4.5 lens in Compur shutter. On the technical side the methods I used were those which I developed with a previous camera taking 3×4 cm. pictures, and I find the habits of fine-grain development and careful processing a tremendous help in obtaining flawless negatives of good enlarging quality. I have no difficulty in obtaining whole-plate prints from even quite small portions of the "Brilliant" negatives.

Panchromatic film is used exclusively, and is developed in total darkness according to proved time and temperature

Fig. 1. Most attractive to the eye, in the print the background is much too restless.

of making the background patchy enough to obscure the outlines of the two children, so that they do not stand out as clearly as the subject of a picture should do. The patch of sky behind the boy's head, which is the highest light of the whole picture, is also a bad offender in distracting attention from the children.

Fig. 4. CONFIDENCES.

DEVELOPING Holiday Exposures

By
J. SYDENHAM CLARKE.

THOSE whose holidays are already but a pleasant memory will be faced, if the holiday has been photographically fruitful, with the problem of developing a number of rolls of film. And perhaps some of those on holiday now, or expecting to go soon, may already be wondering if they should limit the number of their exposures in view of the fact that they have no more than the usual amateur facilities for the development of films.

Throughout the rest of the year, the average amateur never has more than one film at a time awaiting development,

film and apron, but after a little practice the operation is simplicity itself. The first film is inserted in the clip, emulsion side down, i.e., next the apron, and the second is inserted emulsion side up so that the two backs are in direct contact. If held and wound as in the illustrations it will be found that it is possible to load them with very little risk of entanglement or of touching the emulsion.

After the usual development and fixation it is advisable to run each spool separately through clean water to remove any chemical which may have seeped between the films and may still be adhering to the backs. Then the films are rewound on to the spool and put back into the tank to be washed.

A Gross at a Time.

If still further extension of the facilities available for the "mass production" of negatives is wanted, it might seem that it would be necessary to obtain a second tank. There is nothing to be said against this suggestion except that it is rather expensive. It is more econo-

Fig. 1. Clipping the two films and the apron to the spool.

so he provides himself with a tank and regards himself as fully equipped. So he is, except for the holiday accumulation, which may perhaps amount to a dozen films. Developing these will take up quite a number of evenings, mainly because of the necessity of waiting, after each film is finished, for the apron to become completely dry.

The Dangers of Moisture.

It is a very unwise procedure to develop films in a Correx band on which are any traces of water remaining from the washing of a previous spool. It is also practically impossible to dry the band completely by wiping it or other such means; it has to be left for some considerable time to dry itself naturally. However, when more than one film is waiting to be processed it is only natural for the operator, with human impatience and the best of intentions, to give the band a perfunctory rub with a cloth and proceed straightway with the next film. More often than not the result of this is a most perfectly shaped watermark on the two best negatives.

The 35-mm. film used in miniature cameras is unique in that it has no gelatine coating on the back, which is just plain celluloid. It is therefore possible to tank two miniature films together, back to back, without any danger of their sticking together. By this means it is very easy to halve the time needed for developing the accumulation of holiday films.

Loading two panchromatic spools in total darkness for the first time was more or less of a nightmare of tangled

mical to buy a second spool and apron only, these costing little more than half the price of a complete tank.

When using more than one spool, the tank is reserved for development, and fixation and washing are carried out in a pudding-basin or other vessel of reasonably suitable size and shape. Economy in hypo is not a matter of importance,

Fig. 3. This dog's basin serves well for fixing, and, as here, for washing.

especially as it can be used again, but if it is possible to find a dog's basin which is as close a fit to the spool as that illustrated, little more hypo will be needed than if fixation took place in the tank itself.

The procedure here is simple; when the development time for the first pair of films is up, the light is turned out and the complete spool is taken out of the tank, dipped into a hand-basin or pail of water to rinse off the developer, and dropped into the basin of hypo. The light may be turned up at once if the basin is covered to prevent direct light from falling on the unfixed film.

Fitting them in.

While this first pair is fixing, the second spool may be loaded with two more films and lowered gently, with a twirling movement to remove air-bubbles, into the tank from which the developer should not have been poured out. By the time the second pair of films is ready for fixation, the first will be ready for washing; they may be put back into the tank, now emptied of developer, for this, while the second pair can be washed under the tap in the vessel in which they were fixed.

During the whole process, two operations are proceeding simultaneously except while the first film is being developed. Allowing half an hour for this, including the time taken to load the spool, means that four films can be hung up to dry within two hours of starting work. The result is one gross of negatives in an evening, at which rate the most prolific photographer should be able to develop all his holiday exposures before his holiday memories have faded.

Fig. 2. Hold the spool like this for winding.

Modern Miniature Cameras

THE KINE-EXAKTA.

IN general design the Kine-Exakta follows its larger prototype the "Exakta" reflex, but, as its name implies, uses 35-mm. ciné film as the negative material instead of ordinary roll film. It takes 36 pictures, each 24×36 mm., at one loading.

The general form of the camera can be seen from the illustration. It is a single-lens reflex of fixed extension, the lens—or lenses, for they are interchangeable—being equipped with focussing mounts. The camera sent us for review was fitted with a 5-cm. Tessar of aperture $f/2.8$, and this focussed to 2 ft. 6 in. A focussing scale, with depth-of-focus indicator, is engraved on the mount. The shutter is of course of focal-plane type.

The difficulty of accurate focussing with so small a picture has been completely overcome. The focussing screen itself is a plano-convex lens, with the plane surface—which is downwards—matted to receive the image. The picture seen is therefore extremely brilliant, even to the corners, and enlarged enough to allow of accurate focussing with the smaller lens-apertures. For critical focussing at full aperture the hood contains a powerful magnifier that can be pushed into place in an instant, and springs back out of the way on touching a spring. With the magnifier down, the hood forms a particularly good frame finder.

One lever winds the shutter, resets the mirror, moves the film along and operates the automatic exposure-counter. As the mirror is spring-raised, the picture on the screen vanishes when the release is pressed, and does not return until the mirror is reset. Since this operation also winds film and shutter, the sight of the picture on the screen is an infallible guarantee that all is ready for exposing.

Two dials control the shutter speeds. One of these, which can be set before or after winding, controls speeds from $1/25$ th to $1/1,000$ th second, while the other gives slower exposures from $1/10$ th to 12 seconds, and provides, when required, a delayed-action release for all speeds down to 6 seconds. This second dial has to be reset, as a separate movement, for each slow-speed or delayed-action exposure.

The back of the camera is removed entirely for loading, which is very simply done. The end of film protruding from a standard daylight-loading cassette is pushed under a spring on the removable take-up spool, and cassette and spool are dropped into place in the camera. The film joining them is tightened by a turn of the rewinding knob so as to hold it in engagement with the sprockets, and the back is replaced. The fogged end of film is wound off, the counter set to "1," and the camera is ready.

Other refinements include a knife, operated from outside the camera, for cutting the film at the mouth of the cassette when it is desired to develop part only of a length of film. When the hood is closed, the shutter-release is locked so that the camera can be carried with the shutter wound without danger of making an exposure by accident. An automatic contact for synchronous firing of flash-bulbs is built into the camera.

The dimensions of the Kine-Exakta over all projections are $5\frac{1}{2} \times 3\frac{1}{2} \times 2\frac{1}{2}$ in., and the weight is $3\frac{1}{2}$ oz. The model reviewed is priced at £38 10s., but the camera can be had with other lenses at prices from £27 10s. Interchangeable long-focus lenses, of focal lengths from 12 to 25 cm. are available. Camera and accessories can be obtained through any dealer, while for further details application should be made to the sole importers, Messrs. Garner & Jones, Ltd., Polebrook House, Golden Square, W.1.

Miniature Camera Gossip

By LANCELOT VINING.

FIRST of all I must thank those readers who were kind enough to write or telephone me in connection with the Champlin No. 15 developer; two of them even offered to send me samples of glycin to experiment with. I do appreciate their kindness, and regret I cannot reciprocate by acceding to their requests. One was for information about a certain miniature camera and lens which I do not ever remember having seen, let alone operated, and the other asked for a comparison between the Leica and Contax $f/1.5$ lenses. I would not dream of attempting this; it would be most unfair, as I have been using one of them for two years and the other only for one day.

After many recent experiments I have decided that in future I shall use the No. 15 for I.S.S. which has received only a minimum of exposure. I have no evidence that it increases film speed, but I am certain that so long as the solution is pale olive green, it at least does not decrease it, and I do find it gives me a nearly grainless result with this ultra-fast film, combined with very good detail in the shadows and a negative of really fine quality.

One reader suggests that the colour difficulty may be caused by London water; he may be right, for I notice that most of the letters whose writers

leather, and fits into a little leather case.

The day arranged turned out to be very wet and there was a very bad light, so the photographs had to be taken indoors near a window. I used the Contameter 8-in. lenses and Agfa F film.

A VERY CLOSE "CLOSE-UP."
Taken with Contameter 8-in. lenses, $\frac{1}{2}$ sec. at $f/11$.

I exposed by meter, and varied the time in the direction of over-exposure, as I expected trouble when it came to printing out the writing. However, it shows fairly well in the illustration.

Take Your Choice.

Returned from the sea with three rolls of F, one exposed in very dull light, the second in what I would call glare (a type of light exclusive to the sea), and the third in full sunshine, I developed them as follows: the dull in D76, glare in D76 diluted 50 per cent, and for the full sun I used Meritol. I have no regrets over this experiment.

On Reflection.

The Highbury Studios offered me a very interesting photograph of eight girls dancing on a very small floor. In the finished film they appear as a troop of hundreds, a result which is obtained with a series of mirrors.

The eight dancers made a simple photograph, but the mirror shot was not so easy; the nearest girl was almost on top of the camera, and I was very uncertain as to the distance of the farthest dancer in the reflection. I was given the best light available, and in this gave $1/50$ th at $f/8$ with the focussing at 20 ft., which, as the illustration shows, just about produced the desired result.

EIGHT DANCERS. Agfa I.S.S., 12 mins. in Champlin 15.

have experienced no trouble bear provincial post-marks.

Contameter Wanted.

Mr. Charles Gunner, of Egham, who has written and illustrated a miniature book about Windsor Castle which the Queen has purchased, invited me to photograph it. Each page of the book measures $\frac{3}{8} \times 3/10$ ths in., and there are 100 of them. The book is bound in

Inexpensive Miniature

Photographing Sporting Events

By C. O. THOMAS.

"Austin Seven."

IN the summer months outdoor sporting events can provide extensive scope for the user of the moderately priced apparatus. My own interest is in motor-car reliability-trials and speed events, and a portion of most week-ends is spent as spectator at some observed hill, eliminating test or hill climb.

Road speeds of the subjects vary considerably from that of the vehicle which just struggles to the top of an observed hill to that of a racing car moving at "100 per" or more, and when photographing these events I make a habit of "panning," regardless of the car's speed or the shutter speed in use. In order to allow the use of the very shortest exposures to stop subject-movement a hypersensitive film is used, and I usually find that 1/250th sec. at full aperture—in my case f/3.5—gives adequate exposure, while for the very fast cars I have 1/500th in reserve on my Baby Ikonta.

Some results—lucky ones perhaps—that I have had with a much simpler miniature make the value of "panning" very clear. The picture "Beggar's Roost" was taken with a Baby Box Tengor, the single shutter

speed of which is probably about 1/25th second. The car is most gratifyingly sharp, though the background is very badly blurred.

But even though a car moves as a whole, it is not at all easy to swing the camera at so exactly the right speed as to get a sharp picture every time when using shutter speeds as slow as this.

With the direct-vision frame type of view-finder fitted to the Ikonta, it is a good tip to make sure that the subject is well into the field of view before making the exposure. On one occasion I found myself with only eight exposures left and no spares. The accompanying illustration labelled "Austin Seven" shows what happened to no less than five of my jealously guarded "frames." In some cases I did not get even a wheel into the picture, in spite of seeing the object clearly in the finder—or so I thought at the time.

Although amazed when I first saw the negatives, on thinking it over afterwards I attributed these failures to the fact that the camera is more easily held for upright pictures, while for a subject moving horizontally, the alternative long shape gives more latitude for error.

Much the same technique applies to photographing other types of events, such as athletics, in which the photographer may be interested; but it must not be forgotten that where parts of the subject show independent movement, as do the arms and legs of a runner, both "panning" and high shutter speed will be needed to secure sharply defined results.

Climbing "Beggar's Roost."

We would remind readers that they have a standing invitation to submit suitable illustrated articles for inclusion in these two columns. Our many readers who use miniatures listed at ten guineas or less are always interested in a story of success in which they can find inspiration or encouragement, or even to hear of failures from which they can derive a useful warning. We therefore hope that no user of a moderately-priced miniature will feel too bashful to send us his contribution, for which payment will be made, if published, at our standard rate.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

BAD COLOUR.

Could you please tell me why the enclosed enlargement is greenish instead of black? I am sure that no white light was escaping from my enlarger, and developer and fixer were both freshly made up.

G. W. (Edinburgh.)

The colour of your print has nothing to do with escaping light from the enlarger; this could only produce fog. If prints have come out a good black on other occasions, the most likely reason for the colour of the one you send is over-exposure. If, however, your blacks are never as good as they should be, it is probably due to an unsuitable developer for the paper; it may contain too much or too little bromide

METHODS OF FOCUSING.

Of the two methods of focussing a miniature, by front cell and by moving the whole lens bodily, has either any marked optical advantage over the other?

G. H. (New South Wales.)

As far as we are aware there are no objections to front-cell focussing, provided that the lens has been designed to be used in this way. But we should not expect it to be a satisfactory method of focussing for very near objects—full size copying, for example—as it would seem likely that the corrections of the lens would only hold good over a moderate focussing range equivalent to a small extra extension beyond the infinity mark.

FILM-SPOOL DIAMETER.

I have just finished a Continental film, which I have used for the first time, and notice that the spool is decidedly smaller in diameter than spools of other makes I have previously used. In using this Continental spool in the take-up position, will it make any difference to the automatic exposure counter?

M. F. D. (Abingdon.)

You do not mention the make of your camera, and without further details of the mechanism we cannot guess whether the slightly different spool size that you mention will or will not upset the film counting. You should be able to determine this for yourself by examining the mechanism. If not, we can only suggest that you try a film and see if the pictures are properly spaced. In case they are not, we suggest that you stand back a little from your subjects, so that, if the edges overlap, you will not lose any part of the subject that you want to include.

ALTERING A MINIATURE.

I have an "Exakta" which makes 8 exposures on V.P. film. Is it possible to have it altered to take 16 exposures like the Kine-Exakta?

W. E. S. (Edinburgh.)

The Kine-Exakta takes 36 exposures on a length of 35-mm. film, and not 16 on a V.P. film as you seem to think. The importers of the Exakta camera (Messrs. Garner & Jones, Ltd., Polebrook House, Golden Square, London, W.1) would know more about the possibility of altering it in the way you suggest than we do, but we do not think the alteration would be possible, owing to the fact that the shutter and film-wind are coupled together.

UNEVEN DEFINITION.

In the enclosed enlargement you will see that although parts are beautifully sharp, one side is distinctly blurred. The enlarger is home-made and uses the camera lens. The negative itself is needle-sharp everywhere, and appears so even when examined under a magnifier. Can you help me to find the cause of the lack of sharpness?

J. C. L. (Ireland.)

Without actually examining your enlarging equipment we cannot say definitely what is the cause of the trouble with your enlargement, but it suggests that the bromide paper and the negative are not parallel, or that the lens-board is not parallel with the negative. Alternatively, the film may not be held quite flat in the enlarger. If you investigate these suggestions, paying particular attention to the direction and amount of lens-movement necessary to get sharp that part of the picture originally blurred (neglecting the rest for the moment) we think you should soon find yourself on the track of the flaw in your apparatus.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXCVI.

Mr. A. B.
DE LA VERGNE
(Colorado.)

From information communicated to our Special Representative.

"MY work in photography is confined almost entirely to portraiture and figure studies taken in the studio. My camera is an 8×10, equipped with a reducing back, most of the negatives used being 5×7, and artificial light is employed exclusively. I seldom resort to the so-called thumb-nail sketch, finding it much more satisfactory to pose the model according to the idea one has for the picture, and to do the compositional work on the ground glass.

"Finding the model to suit the idea is not always easy, and it has been my experience that the work of the professional model is not always satisfactory. My best subjects have been secured from the dancing and dramatic schools.

"In the matter of lighting I have used at different times the carbon arc, Mazda bulbs, Photoflash and Photofloods, and have found them all satisfactory for certain subjects; but my preference for most of the work is a combination of arc and Mazda.

"I have compounded and used nearly all kinds of developers for negatives, but since my first trial of Kodalk for an alkali, over two years ago, I have been an enthusiastic user of metol-hydroquinone developers made with this chemical. Nearly any grade of developer from very soft to extreme contrast can be made, it is non-staining and keeps well.

"I work with a 12-in. anastigmat lens, and make my negatives sharp, preferring to do any softening in the making of the enlargement. All my exhibition prints are made in the 11×14 size, and about ninety per cent of them are straight enlargements on bromide or chlorobromide papers. At times I make bromoils and bromoil transfers, but I have had so many of these prints ruined in the mails by rough handling that I have confined my exhibition work almost entirely to straight enlargements.

"I am not in any sense one of the so-called purists, but my chief concern in the technical part of photography is securing a good negative—one that will require a minimum of retouching, and little or no work on the finished print. The manufacturers offer many wonderful grades and surfaces in their papers, and it is my belief that a print suitable for salon purposes can be made by straight enlargement if one has a good negative.

"Proper mounting enhances the value of good prints, and for use in this country mine are placed on 16×20 cards of white or light-toned stock. Postal restrictions of course force us to send prints unmounted to other countries."

(A further example of Mr. A. B. De La Vergne's work is reproduced on one of the centre Art pages.)

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"HAYFIELD IDYLL," by E. Schneider.

AS was the case with the print by the same author—"Summer Landscape"—which formed one of the illustrations reviewed in these columns last week, this subject, "Hayfield Idyll," is also characterised by its admirably caught figures, its fine expression of life in the open, and a subsidiary, but none the less delightful, effect of soft and mellow sunshine.

The sky, too, is not without interest, for it is graced with the light clouds of summertime; its tones are of ample depth; and it not only forms a satisfactory setting, but rounds off and completes the scene. It owes its fine rendering, no doubt, to the command over technique that the print exhibits. The range of tone is very full; it is wholly harmonious; and, without any suggestion of harshness, conveys an amazing impression of vigour.

On the manipulative side, this fineness of quality and strength are attributable, in the first instance, to an exposure that is almost precisely correct, and, in the second, to a well-calculated judgment in the time of development of the negative so that its contrasts are fully recorded on the grade of printing paper selected for the print. Had the exposure been appreciably greater, much of the modulations in the lighter tones would be lost and the darker values would be lacking in depth, so that, instead of vigour, an impression of flatness would be conveyed. If the exposure had been reduced, the darks would be devoid of gradation; the rendering would be deficient in aerial perspective; and, in all probability, the features of the figures would be indistinguishable.

Development of the negative has to be considered in relation to the printing paper that will subsequently be employed. If it is insufficient, the negative will be deficient in contrast and a print from it would be flat and limited in its range of tones. If development is extended too far,

the contrast will be excessive and too great for the range of the paper, so that, either the lights will be unprintable, or, if not, the darks will be without distinctions of tone and utterly choked up. It is possible, with the number of printing papers available, to correct any reasonable amount of miscalculation in the degree of development, but, as a rule, it

this feeling of strength is enhanced by the forceful nature of the arrangement. There are three figures included, and, as I look at the print, that of the man (1) attracts my attention first, no doubt because he consists of the greatest mass and weight of tone in the whole thing. He is placed in a strong position, just off the centre, and that, again, has a good deal to do with his power of attraction. My eye then passes to the girl (2) because she is next to the dark figure of the man and because her tone, which is generally light, offers a very forceful contrast in value. Either extreme of tone, light or dark, forms a point of attraction, and if, as in this instance, the two are placed in conjunction, the concentration of interest they excite is as powerful as anything that can be devised. Moreover, it provides the reason why the arrangement of the composition stresses the impression of vigour suggested by the long scale of tones.

The figure in the distance (3) is not of much moment in the theme, but, after dwelling on the other two for a bit, her presence is appreciated. She has, however, neither the importance of scale nor the weight of tone of the others and her position is relatively weak, so that, after a brief glance,

I find my attention returning to the two central figures, where, after taking in the setting, it is held. The fact is sufficient to indicate the satisfactory nature of the composition in its main features and to show that it well fulfils its function.

That, I think, is beyond dispute, but, all the same, I do not care very much for the inclusion of the dark structure on the left behind figure (3), and could have wished that it had been found possible to avoid it. To do so, however, might have involved upsetting the rest of the arrangement, and more would have been lost than gained.

"MENTOR."

will be found good practice to keep this facility in reserve for those abnormal subjects which sometimes arise, and endeavour to maintain a standard degree of development suitable for one particular grade of paper.

Here, the range of the printing paper is almost fully extended. The very highest lights are just the minutest shade deeper than the underlying paper base, and the darks, at their strongest, are about the maximum the paper can afford. From this extremely lengthy range arises the impression of vigour of tone with which the print is endowed.

But to a not inconsiderable extent,

HAYFIELD IDYLL.

PICTURES by Novices

*SOME CRITICAL COMMENTS on
the Beginners' prints reproduced on the opposite page.*

WITH the exception of Nos. 1 and 4 of the prints reproduced on the opposite page, all of them show a tendency towards the unusual in their choice of subject material. If they were original efforts or really got across with their theme, I should feel inclined to give them every encouragement, but they give me the impression that they are rather indifferent imitations either of London Salon successes or the reproductions that appear, week by week, in our centre pages.

The Real Thing.

The first impression of an engine wheel and couplings, as far as my recollection goes, was a study by Alex. J. Krupy, of Chicago, entitled "Force," which was hung at one of the London shows in 1933, and reproduced in *Photograms of the Year* for the same year.

It was an undoubted achievement, and relied for its appeal on a fine effect of light upon the polished steel of the couplings, their reflections, and the way they were displayed against the sombre tone of a driving-wheel behind. The composition betrayed an admirable sense of design and the quality of the print was superb.

Since then, numbers of more or less indifferent imitations have been submitted year by year, and, needless to say, have met with the fate they deserved. The real thing was a success, but its successors were not, and whether No. 2, "Power," by Stanley L. Connars, owed its inspiration to the example quoted or not, it has to stand up to the comparison.

And, quite candidly, it has not the effect nor the design nor the quality to do it. It is a plain straightforward photograph of some engine wheels. It is technically sound, and for a beginner quite good work, but, while it is unusual in the sense that subjects of its type are not ordinarily chosen in that class, it does not really convey a suggestion of power as its title implies, and there is the feeling that it owes its existence either to the picture mentioned or one of its imitations.

Following Examples.

Most of us will remember "Force," but those who do not will be able to refer to a copy of *Photograms*, either

at the local photographic club or the nearest public reference library. Turn it up and see for yourself what I am talking about.

It is all very well to study the works of the masters of photography. Such a study can be extremely useful if it be taken as a guide to methods of treatment, arrangement of subject, and so forth, but it will not be of the slightest use to you in your own work to go out and find the same sort of subject and copy it exactly—that is, of course, unless you do so simply with the idea of confirming how it has been done and not of passing it off as work of your own.

By all means learn what you can, not only from the pictures we reproduce from time to time, but also from etchings, paintings, and any other form of graphic art, but choose your subjects for yourself, work out your own ideas, and apply the lessons you learn simply as an aid towards the expression of the themes you think of for yourself, for only by so doing will you be able to develop your artistic individuality and so acquire a real and intrinsic originality.

Personality in Pictures.

If you can do this and stick to a line you have laid down for yourself, you will, eventually, find that your works have a character of their own, and they will reflect your personality.

With No. 3, "Sea Gazing," by H. Haydon, there is a similar suggestion of imitation of a number of subjects of the same kind, all of which betrayed the same upward-looking point of view, the same sort of figure or figures looking over a balcony or railings, or, perhaps from the upper deck of a ship, and the same portrayal of light tones against a darker sky.

Were it not for these previous efforts, "Sea Gazing" could be regarded as a very commendable piece of work, especially as it comes from the hands of a beginner; but it, again, cannot stand up to comparison. Its tones are too indecisive. The figure has not enough weight of tone; the sky is devoid of the depth it should possess, and the sunlit wall not only seems rather degraded but does not stand out against it in the way it would be made to do had the subject been tackled by an experienced hand.

A light filter employed in conjunction with a fully colour-sensitive or panchromatic emulsion would be an aid in securing better values in a subject of this kind, but a superlative technique is also needful as much in the preparation and finish of the print as in the production of the negative.

Form and Finish.

There is a suggestion of pattern afforded by the shadows of No. 6, "The Water-Wheel," by H. R. Grice, but, here again, it is scarcely more than a hint and the shadows do not fall well with the rest of the scene.

Moreover, the lighter portions convey the impression of being burnt out owing to a deficiency of modulation, and printing cannot be carried farther lest the shadows become too dark. Printing on a softer type of paper might overcome this drawback, but the way the shadows fall does not afford a design of good form, and, as an example of what can be done with shadows, the reader is referred to "Geranium," by Dr. F. Ferruccio Leiss, "The Shadow," by S. Izumi, and one or two other examples in *Photograms* for 1933 to which I have already drawn attention.

No. 5, "Father and Daughter," by W. Beck, is less reminiscent of previous work than the others; but portraiture from a low viewpoint has lost its first freshness, and, in any event, it differs so much from the normal point of view and is so inclined to give a distorted rendering of the features that I feel that it would be better left alone—at least, until the ability to make real use of its characteristics has been acquired.

Nos. 1 and 4, "Morning Sunshine," by J. P. Evans, and "Swan and Cygnets," by Clifford Howe, are more inclined to the normal point of view, the first conveying quite a pleasing impression of sunshine, despite its somewhat excessive expanse of foreground, and the second showing a swan and its family in a natural setting.

The family seems a bit confused, however, and, with a little patience and the choice of a more favourable moment for making the exposure, a greater separation between the various elements and a consequent better grouping might have been secured.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

NARROWING DOWN THE SUBJECT.—II.

WHEN I was interrupted by the intrusion of the Summer Number, I was reminding the beginner that a large proportion of his results will be much less satisfactory than they might be if he allows himself to be dependent upon the mechanical trade printer. "One print from each negative" should in most cases be altered to "one print from the proper part of each negative"; and exactly how much of each negative should be used should be a matter of careful consideration to the photographer himself. He ought to know better than anyone else what he wants.

I showed by an example, a fortnight ago, how we can get very much the effect of using a long-focus lens by enlarging only from the middle part of a negative made with a normal lens. More often than not we get unwanted material round the edges of our negatives; and it is

well to get more than we want rather than less, as we can easily leave out, but cannot put in.

Fig. 1 is another example of reducing the subject by selection. Many years ago I took a photograph of the Shakespeare monument in Leicester Square Gardens. It showed the whole of the figure and the pedestal, a large chunk of the gardens, some rather ugly buildings and a generous slab of empty sky. It was a poor performance, even for those days, but it happened to serve its purpose.

Recently, when I took the gilded springbok and other subjects I showed in the last article, I took these spouting dolphins round the base of the pedestal. Then I narrowed down the subject still more by taking the middle one from a slightly different angle, as shown in Fig. 2. It is neither full face nor broadside on, and makes a reasonably good arrangement. Things like these may not

Fig. 2.

be at all great as "pictures," but they make interesting records; and the practice we get in locating and photographing them may stand us in good stead when we are fortunate to discover something better.

All the three illustrations are made from $3\frac{1}{4} \times 2\frac{1}{4}$ negatives, but it will be noticed that the proportions are different. This is because, as I have previously explained, I have a set of masks for each size of enlargement I make.

In this case I was using whole-plate paper, and my masks are the glasses of whole-plate negatives, on each of which is stuck down a thick paper mask. A glance at the negative is generally sufficient to show which mask will suit. Behind this one I place a piece of white card, on which I arrange the image as I think best, by varying the degree of enlargement, and by shifting the negative up and down or from side to side. The masks, of course, give a white margin which is trimmed down to a narrow width afterwards.

One of the masks is cut to the same

Fig. 1.

proportions as the negative, so that when I want to use all (or nearly all) that the negative shows, it is only necessary to centre the image and adjust the size. Fig. 2 was made with this mask.

Another mask uses the whole of the sheet of paper except the margin all round. Many $3\frac{1}{4} \times 2\frac{1}{4}$ negatives can be shortened the longer way, dispensing with some of the material at one or both ends. This has been done in Fig. 1. The subject itself admits of a rather symmetrical arrangement, although the spacing of the three dolphins is not equal. Including more of the setting would have brought in more spotty patches to be toned down.

A third mask narrows down the negative, but shows its whole length. Last time I used it for the upright panel of the gilded decoration; this time it accommodates the horizontal figure of the cat, where nothing else is required but the animal and its immediate surroundings. By the way, every single person to whom I have shown this print has at once turned it upside down to look at the cat's face. Have you?

In Figs. 1 and 2 were fussy light spots in the background, and someone who saw the prints asked how I had toned them down. If they had been done properly he would not have asked, because he would not have known they were there, unless he happened to be a faker himself.

Fig. 3.

As the prints were made only for reproduction, I toned down spots of light in the trees, painted out an advertisement, and subdued several people, with a brush and water-colour. Or I might have done it with crayon and pencil, and fixed the work by steaming the print.

If the prints had been intended for examination I should have proceeded in a different way, and I will again summarise the method, as there are always new beginners to whom it is unfamiliar.

Buy from an artists' colourman the materials for this mixture: 1 oz. mastic varnish, 1 oz. linseed oil, 2 oz.

turpentine. Shake this up, and with a wad of cotton-wool rub it well into the print; then with clean wool rub off every surface trace of it. This alone improves the appearance of a matt or semi-matt print.

To tone down light parts, take a very little oil-colour lamp-black (from a tube) and work it up on a piece of glass with some of the mixture just mentioned. Apply it to the print with cotton-wool, to the depth required, and clean it off with wool where it is not wanted. The print takes time to dry thoroughly; but, if properly done, the work will not betray itself.

W. L. F. W.

"The A.P." Monthly Competitions PRIZES AND RULES.

To encourage pictorial outlook and good technique in the photographic work of our readers in all parts of the world.

(I) For Advanced Workers.

This class is open to all amateur photographers.

FIRST PRIZE.—One guinea in cash or "A.P." silver plaque (optional).

SECOND PRIZE.—Half a guinea in cash or "A.P." bronze plaque (optional).

THIRD PRIZE.—Five shillings in cash.

A special prize of five shillings in cash for the best mounted picture.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) All prints must be accompanied by a stamped addressed envelope or wrapper if they are to be returned. Prints receiving an award will be retained.

(2) Prints must be mounted, but not framed.

(3) Returnable prints in the Advanced Section will be sent back with a typed criticism, and classified according to merit.

(4) Prints may be of any size and by any process, and must be the competitor's own work throughout.

(5) The award of a prize or certificate in the Advanced Workers' Competition or any other competition or exhibition will not debar the competitor from entering again on future occasions and winning further prizes.

(II) For Intermediate Workers.

This class is to encourage those readers who have passed the "beginner" stage and may have won an award in the Beginners' Competition, but have not progressed sufficiently to enter in the Advanced Competition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 10×8 in., and can be by contact or enlargement by any process, and may be mounted.

(2) The whole of the work (exposure, development, printing, etc.) must be carried out by the competitor.

(3) Prints entered in the Intermediate Section will be criticised and returned if accompanied by stamped addressed envelope or wrapper. Prints receiving an award will be retained.

(4) The award of a prize or certificate in the Intermediate Competition debars the competitor from entering this competition again, but he is then eligible for the Advanced Workers' Section.

(III) For Beginners.

This class is open to those who have never won an award in any photographic competition or exhibition.

FIRST PRIZE.—Half a guinea in cash.

SECOND PRIZE.—Five shillings in cash.

CERTIFICATES OF MERIT.

In addition to the general rules (see below), the following conditions apply:—

(1) No print must be larger than 6×4 in. Contact prints or small enlargements up to this size are eligible, but must be unmounted.

(2) The exposure must have been made by the competitor, but developing and printing may be the work of others.

(3) No prints can be criticised or returned.

(4) The award of a prize or certificate in the Beginners' Competition debars the competitor from entering this section again.

General Rules.

(1) Any number of prints may be entered, but each print must have on the back the appropriate coupon

(see advertisement pages) the date of which must be within five weeks of the closing date of the competition. Overseas readers may use the most recent coupons to hand.

(2) Each print must have on the back the name and address of the competitor, and the title.

(3) All entries must be addressed to The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the package must be marked on the outside "Beginners," "Intermediate," or "Advanced," as the case may be.

(4) No packages will be received on which there are postage charges to be paid.

(5) No communication on other matters should be enclosed with competition prints. No correspondence in connection with the competitions can be undertaken.

(6) The entry of a print will be regarded as a declaration that it is eligible under the rules, and that the competitor agrees thereto.

(7) No responsibility is taken for the safety of prints, and the Editor's decision on all points connected with the competitions is final.

(8) The publishers of *The Amateur Photographer* shall have the right to reproduce, without payment, any print entered, or to allow its reproduction in any other paper quoting from *The Amateur Photographer*.

(9) The closing date of each competition is the last weekday of the month. Prints arriving late will be entered for the next month's competition.

(10) The cash prizes awarded in these competitions are dispatched on the fifteenth of the month following the announcement of the awards.

The closing date for the July competition is Saturday, July 31st, and for the August competition, Tuesday, August 31st.

MAKING BETTER SNAPSHOTS—8

By DAVID CHARLES.

This article is the eighth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. Even though the donkey was coming towards the camera, a quick shutter was needed to get his legs sharp.

Fig. 2. If the donkey had been trotting the leg-movement would have been too fast for almost any shutter.

A FAVOURITE holiday subject is the donkey-ride on the beach, but "picturesque" as donkeys often appear to the eye, they certainly present problems to the picture-maker. When standing still, which is naturally the easiest condition in which to photograph them, donkeys always look half asleep. They never have the alert expression of a horse, but stand in a depressed attitude with their eyes half-closed.

Too Fast for the Shutter.

When he is actually on the move, of course, a donkey will look a little more alive. But it is just then that his little legs are going wiggle-waggle "nineteen-to-the-dozen," much too fast for the average snapshot camera to catch. I do not recollect ever having seen a really successful snapshot in which the donkey is actually running.

Yet I have always felt that there should be some "possibilities" for pictures

in these shaggy creatures. In any case, thousands of cameras will be aimed at donkeys this year, so here are a few hints for good shooting.

On the Move.

I could not find a snapshot of a donkey trotting on the beach, but here, in Fig. 1, is the next best thing. He is moving faster than one would think along this lane. It will be seen by the very slight "depth of focus" that a very rapid lens was used to catch him. And for any running animal it is necessary to decide beforehand at what spot on the road (or beach) one will shoot him, and to shoot precisely when he gets there. Otherwise he will be either very small indeed, and perhaps out of focus, or he will loom too large, and will be still more blurred by rapid close-up movement.

Fig. 2 was obviously much easier to photograph, and is more "pretty-pretty" too, but as I said before the

donkey takes a nap the instant he stops! This pair of results make a very good reminder of the rule never to make snapshots of rapid movement right across the view. Only a very rapid lens and shutter could take No. 2 if he were running; diagonally and not too near, as in No. 1, is much safer.

Food Works Wonders.

Perhaps the surest way to arouse the donkey's interest is by the offer of food. Even if one does not number the proverbial carrot amongst one's seaside impedimenta, a lump of sugar should not be far to seek, and will provide the motive for a snapshot like that of Fig. 3. Imagine the background away, and it would be a very successful effort.

Both rider and mount in Fig. 4 are clearly interested in something. Art appeals to man alone; but man and beast alike like food! Probably both had their eye on that lump of sugar.

Fig. 3. Interest is often best awakened by food.

Fig. 4. Perhaps food explains the success of this; neither mount nor rider here looks bored.

A NOTE *on* YACHT Photography

By GURNARD HEAD.

NEXT week sees the opening of the most important yachting regatta in this country—"Cowes Week." This year, although shorn of some of its glory by the absence of Royalty, by the non-appearance of some of the "big" racing yachts, and by the fact that the Coronation Yachting Festival at Torbay was a counter-attraction for yachtsmen, the "week" in the Solent will still provide the

The best viewpoint is generally when the deck and crew can be seen and with the light on the sails. 1/100th sec., f/11. Fast 'chrome film, pale yellow filter.

Occasionally good effects are secured "against the light," when the sails of the yacht shield the lens from direct sunlight. The amount of reflected light present is quite sufficient to illuminate the shaded side of the subject. 1/200th sec., f/11. Fast 'chrome film. A lens hood is very essential in this case.

Even windless days, when racing is at a standstill, will provide good pictures. Here the most can be made of the reflections in the water. 1/100th sec., f/11. Fast pan. film, medium filter.

photographer with many fine pictures of this most beautiful of all open-air subjects.

While no two photographs of racing yachts in action are ever alike, the illustrations on this page depict a few phases most likely to recur, and are well within the range of any amateur. The data given with each will be useful for those readers who are fortunate enough to be able to attempt them.

In general, it may be observed that almost any type of camera with a reliable shutter will serve for these fairly high speed snapshots on the sea. The light is at its best, and the shutter can, in most cases, be used at its quickest. If rapid ortho. or pan. films are used a small stop and a filter can be employed

all the time, especially if the sun is shining. A direct-vision finder is best for this work, and when sighting the subject always try and leave plenty of space in front of the advancing yacht; it gives a better idea of action.

A lens-hood is a necessity—to cut out glare from sky and sea. If possible take the picture from another boat—the best viewpoints are only to be secured in this way; and, above all, avoid getting spray on the lens. If, however, the lens does get splashed, wipe off the salt water at once with the corner of a soft handkerchief that has been slightly dampened. A glass colour-filter on the front of the lens is easier to clean than the lens itself, and is an argument in favour of keeping it permanently in position for this work.

A good sailing breeze—the ideal day for action subjects. 1/200th sec. f/11. Fast pan. film, pale filter.

Amateur Cinematography

Filming Summer Games By ORLTON WEST.

WITH their rich variety of action and human interest, summer games provide a fascinating subject for the amateur cinematographer, though not a simple one from the technical point of view, for one has so little control over the movements of the players in relation to the position of the camera.

Of course, if you possess a telephoto lens, it is simple enough; you can shoot your details from a distance, but using the average camera with a fixed-focus lens, you have to be resourceful, making the most of what photographic opportunities there are.

Test your camera skill on the tennis court. If you can pan with the players as they dart about, without producing a blurred image on the screen, and obtain clear views of them, unobstructed by the net, you will have overcome the chief difficulties of photographing this game.

Experiment shows that for distance shots it is best to shoot downwards from a height, as, for example, from the back window of a house overlooking the ground.

Usually, you have to secure your shots from within the tennis grounds. It is then impracticable to include both players or pair of players in the same shot. Greater clarity will be achieved, and confusion avoided, by filming one end of the court at a time.

Stand in a line with the net, at any distance up to twenty yards from the post, according to the angle of your lens and the area of court to be included.

From this central position you can direct the camera at either end of the court as required.

Cricket is a more difficult game to film than tennis, on account of the players being spread out over a wider area. It is best to wait until a practice game comes along, when you may be permitted to take up a convenient position just behind the bowler, or close to the batsman.

The best time of all to film batting is during net practice. You can then protect your lens from possible damage by the hard ball by standing just outside the net, and, if it is of the usual mesh, shoot through one of the holes.

During these summer months, swimming is a favourite ciné subject. At the open-air baths you may secure some splendid action shots by merely standing on the edge and shooting down into the water. But keep one eye on the position of the sun.

And another point: when "aiming"

upwards at the high diving board, remember to stop down your lens, as the background of sky will be considerably brighter than objects on the ground. A filter should be used if the clouds are light, or altogether absent.

Bathing at the seaside can be photographed in several ways. While the children are learning to swim or splashing about in shallow water, you may secure some grand records by standing waist-deep in the sea, and panning after them as they pass to and fro.

Another method is to shoot downwards from a breakwater, or, at high tide, from the edge of the sea wall. This is a good place and time to secure diving scenes, too.

Expert swimmers, who prefer to travel some distance out from the shore, may be followed in a rowing-boat. Excellent, this, for those alongside photographs which reveal so clearly the under-water movements of arms and legs when the sea is smooth. If you stand up, plant your feet wide apart in the bottom of the boat, otherwise it will rock, producing a see-saw effect on the screen.

In all swimming scenes take care to

exclude from the lens not only direct sunlight, but reflections of the sun from the surface of the water. The good old rule, sun over the shoulder, is the safest one to follow.

Apart from their interest as holiday records, your sporting shots may have an instructional value. By pointing out faults, they may help your friends to improve their diving, golf handicaps, tennis serves, etc.

I know one tennis enthusiast who benefited greatly by being filmed at play. Several shots were taken from different angles and distances—close-ups from behind, showing in detail the positions of the arms and shoulders both before and after serving, followed by mid-shots from the front, revealing the poise of the whole body, as well as the forward swing of the racket.

These scenes provided a useful exercise for the cameraman, and, when joined up at the editing bench and projected, presented the tennis enthusiast with a searching analysis of her serve. She was able to view her mistakes from the point of view of a critical observer on the court, and to see exactly where she had gone wrong.

An ideal action subject for the amateur cinematographer is provided by swimmers in all phases of their progress. A reference to this is made in the article on this page.

Popular-Size Folding Plate Cameras

WE continue below our survey of popular-size cameras, giving this week descriptions of folding plate cameras in the $3\frac{1}{2} \times 2\frac{1}{2}$ inch size. Folding roll-film cameras were described in our Summer Number last week, and $3\frac{1}{2} \times 2\frac{1}{2}$ reflex cameras will be described next week.

Cameras are arranged, as nearly as exigencies of space will permit, in ascending order of cost. In the price list on the next page cameras are listed with each of the lens-shutter equipments available. The suffix S following the name of the shutter indicates delayed-action release.

The names of suppliers are given; for addresses, please refer to our advertisement pages.

ANCA.—Folding single-extension camera for plates and film packs. Fitted anastigmat lens in between-lens shutter. Focussing by radial lever. Has rising and falling front and both wire-frame and brilliant finders. Dimensions, $4\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 22 oz. Price, complete with focussing screen, from £5 5s.

Kodak, Ltd.

PATENT ETUI JUNIOR.—Camera body identical with that of Patent Etui. Fixed extension, with focussing by lens cell to 2 ft. Fitted Radianar f/4.5 anastigmat. Weight, including lens, shutter

oz. Price, Model I, from £8 5s. Model II, from £13 5s. F. G. Phillips, Ltd.

PIONEER.—Folding double-extension camera for plates and film packs. Fitted 10.5-cm. f/3.5 Trioplan anastigmat in delayed-action Ibsor shutter. Focussing by rack and pinion. Rising and cross front. Fitted both frame finder and brilliant finder with level.

and film-pack adapter, 16 oz. Price, including focussing screen and film-pack adapter, from £6 5s., according to shutter.

Sands Hunter, Ltd.

NORFOLK PLATE CAMERA.—Double-extension folding camera for plates and film packs. Rising and cross front, with micrometer movement. Focussing

packs. Fitted 10.5-cm. f/4.5 Tessar in delayed-action Compur shutter. Rising and cross front by micrometer screw. Rack and pinion focussing. Wire-frame and brilliant finders. Dimensions, $5\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 19 oz. Price, including three metal slides, £10 10s.

Norse Trading Co., Ltd.

RECOMAR.—Folding double-extension camera for plates and film packs. Rack and pinion focussing. Rising and cross front, both operated by worm. Has wire-frame finder in addition to large brilliant finder. Fitted with anastigmat lens in Compur shutter.

Dimensions, $4\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 24 oz. Price, including three plate-holders, from £11 17s. 6d. Kodak Ltd.

CERTOTROP.—Folding double-extension camera for plates or film packs. Rising and cross front operated by micrometer movement. Detachable lens panel. Focussing by rack and pinion. Large brilliant and wire-frame finders. Quick-action clip-on metal

Brilliant and wire-frame finders. Fitted $4\frac{1}{2}$ in. f/4.5 Tessar in Compur-Rapid shutter. Dimensions, $4\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 24 oz. Price £14 2s. 6d., including focussing screen and three metal slides.

Zeiss Ikon, Ltd.

PATENT ETUI.—Folding camera of minimum dimensions for plates and film packs. Fitted 10.5-cm. f/4.5 Tessar in Compur shutter. Rising and falling front. Focussing by rack and pinion. Fitted wire-frame and brilliant finders. A telephoto lens can be fitted.

Dimensions, $5 \times 3\frac{1}{2} \times \frac{3}{4}$ in. thick at edge. Weight, 11½ oz. without lens and shutter. Price, single extension, £14 12s. 6d.; double extension, £15 7s. 6d. Prices include focussing screen and three plate-holders.

Sands Hunter, Ltd.

IDEAL 250/3.—Folding camera for plates and film packs. Focussing by rack and pinion. Double extension to 9 in. Brilliant and wire-frame finders.

July 28th, 1937

packs. Fitted with self-capping focal-plane shutter, speeded 1/8th to 1/1,000th sec. F/2.9 Pentac lens, interchangeable with telephoto. Focussing by radial lever to 2 yards. Direct-vision double frame finder. Dimensions, $5\frac{1}{2} \times 4\frac{1}{2} \times 3\frac{1}{2}$ in.; weight, 32 oz. Price £18 18s., including three double slides.

Dallmeyer, Ltd.

NEW SPECIAL SIBYL.—Folding single-extension plate camera, fitted f/4.5 lens in N. & G. shutter, speeded $\frac{1}{4}$ to 1/150th sec. Focussing by radial

lever to two yards, with depth-of-focus scale on lever. Rising and cross front, with reflector finder showing correct view even when rising front is used. Collapsible lens hood fitted. Dimensions, $5\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 20 oz. Prices from £19 10s., according to lens and equipment.

Newman & Guardia, Ltd.

TRONA 214/3.—Double extension folding camera for plates or film packs. This camera follows very closely the specification of the Maximar, but has specially rigid lens-front and side

struts. Fitted $4\frac{1}{2}$ -in. f/3.5 Tessar in Compur-Normal shutter. Dimensions, $4\frac{1}{2} \times 3\frac{1}{2} \times 2$ in.; weight, 30 oz. Price, including focussing screen and three metal slides, £21.

Zeiss Ikon, Ltd.

UNA.—Double-extension hand or stand camera for plates and film packs. Focussing by rack and pinion. Choice of lenses in N.S. "Perfect" shutter. Front rises to extent of $1\frac{1}{2}$ in. and is fitted with swing action. Revolving back. Tilting brilliant finder showing

extent of view even when front is raised. Double-extension model extends to 93 in. and a triple extension model is made costing £2 extra. Dimensions, $5 \times 4\frac{1}{2} \times 3\frac{1}{2}$ in.; weight, with lens, shutter and film-pack adapter, 38 oz. Prices from £21 10s.

Sinclair & Co., Ltd.

SIBYL VITESSE.—Folding plate camera with specification identical with that of New Special Sibyl, except that collapsible lens hood is not fitted. This model is equipped with f/3.5 lenses. Dimensions, $5\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 22 oz. Prices from £28 10s.

Newman & Guardia, Ltd.

VESTA DE LUXE.—Folding single-extension camera for plates and film packs. Has Adams micrometer focussing to 3 ft. Front supported by trellis bars. Fitted $4\frac{1}{2}$ -in. f/4.5 Xpres lens in between-lens shutter, speeded

1 to 1/300th sec. Rising and cross front, with Identoscope finder showing correct picture even when front is raised. Dimensions, $5 \times 3\frac{1}{2} \times 1\frac{1}{2}$ in.; weight, 26 oz. Price £25.

Adams & Co., Ltd.

IMAGON.—Folding hand or stand camera for plates or film packs. This is a square camera with revolving back, and has triple extension. Extensive rising front with double swing action. Interchangeable lens-panel. Specially designed for use with 17-cm. Rodenstock Imagon soft-focus lens, which is fitted in Compur shutter without delayed action. Dimensions, $4\frac{1}{2} \times 4\frac{1}{2} \times 2\frac{1}{2}$ in.; weight, 42 oz. Price, including three metal slides and three diffusion screens, £34 10s.

F. G. Phillips, Ltd.

TRAVELLER UNA.—Folding hand or stand camera for plates or film packs. Specifications practically identical with that of "Una" camera, but is made in Duralumin instead of wood.

Fitted Ross Combinable f/5.5 lens in N.S. "Perfect" shutter. Dimensions, $4\frac{1}{2} \times 4\frac{1}{2} \times 3\frac{1}{2}$ in.; weight, including lens and shutter, 48 oz. Price £35.

Sinclair & Co., Ltd.

PLAUBEL MAKINA II.—Collapsible single-extension camera for plates and film packs. Fitted with coupled range-finder. Camera front supported on lazy-tongs, by extension of which focussing

is performed. Fitted 10-cm. f/2.9 Plaubel Anticomar lens in Compur shutter. Has direct-vision optical and frame finders and will take telephoto

and wide-angle lenses. Dimensions, $5\frac{1}{2} \times 4 \times 1\frac{1}{2}$ in.; weight, 32 oz. Price £39 10s., including three slides.

Garner & Jones, Ltd.

VERTO.—Double-extension folding camera for plates or film packs. Focussing by rack and pinion. Fitted with 4-in. f/5.5 Combinable lens, in Adams Exacto shutter, speeded 1/200th to 1 sec. Camera has revolving front so that view-finder and shutter release are always in the same position no matter which way up the camera is held. Dimensions, $5\frac{1}{2} \times 3\frac{1}{2} \times 2$ in.; weight, 28 oz. Price £37.

Adams & Co., Ltd.

SQUARE BODY VERTO.—Folding double extension camera for plates and film packs. Specification closely follows that of Verto camera except that body is now square and has revolving back. This model has rising and swing front actuated by micrometer movement. Price, with $4\frac{1}{2}$ -in. f/5.5 Combinable lens, £47.

Adams & Co., Ltd.

PLAUBEL MAKINA IIS.—Specification as Makina II but lens is fitted in front of shutter to allow rapid interchange of lens by replacing as a whole instead of separate components. Dimensions, $5\frac{1}{2} \times 4 \times 2\frac{1}{2}$ in.; weight, 34 oz. Price, with 10-cm. Anticomar lens in Compur shutter, £47 10s.

Garner & Jones, Ltd.

VAIDO.—Folding hand or stand camera for plates or film packs. Extension to 12 in. by rack and pinion. Has square body, with revolving back, and is fitted with self-capping focal-plane shutter to facilitate interchange of lenses. Shutter is speeded 3 secs. to 1/1,000th sec. Double rising and swing

front. Wide-angle rack for very short focus lenses. Fitted Identoscope finder, showing correct image even when rising front is used. Dimensions, $6 \times 6\frac{1}{2} \times 4$ in.; weight, 64 oz. Price, without lens, £36. Tropical model in brass-bound teak, £70 extra.

Letters to the Editor

The Editor is not responsible for the opinions of his correspondents.

PLATES.

SIR,—I was much interested in your article on plates in a recent issue of *The Amateur Photographer*, and I am in complete agreement with most of the views expressed there. I always use plates if possible, and only when considerations of weight and space are preponderatingly great, I use some form of film. May I be permitted a few words regarding the advantages of plates, most of which I must admit are due to the rigidity of the glass support. You have a nice solid article to handle which you can hold comfortably by the edges with your fingers.

1. *Exposure.* In exposing you know for certain that the whole of the emulsion will be in register in the camera, be the plate small or large, since a glass plate cannot bulge under the temperature conditions usually attained in this world of ours.

2. *Processing.* You can lift the plate in and out of the dish, tank or rack with ease; it sits rigidly in a rack for drying, and does not have to be hung up upon a line like so much washing.

3. *Enlarging.* Here again, you have the advantage of a rigid material always in one plane in the carrier. In cases where one is too impatient to wait until the next evening, one can blot off the negative on fluffless blotting-paper and put the damp negative into the carrier of the lantern, make the exposures and complete the washing of the negative whilst dealing with the enlargement. The most exacting photographer cannot ask for more than this.

4. *Retouching.* The plate is its own ideal support for retouching purposes and, the back being glass, one can put on or take off any kind of varnish without fear.

5. *Storage.* Plates do certainly take up a little more room and weigh more than films, but this is not a serious cause for most of us.

These are some of the reasons why I prefer plates to films; perhaps other of your readers will add to my testimony.—Yours, etc.,

C. JONES.

"THE FEMALE OF THE SPECIES."

SIR,—It pleases Mr. Wastell to let the cold water of his pretty wit play on the idea of calling a lady photographer a photographess. And yet—why not?

If Miss Amelia D. Footsore, of Tooting, announces that she is a prophetess and is prepared to do Mr. Wastell's horoscope for two guineas—(Thursday evenings, 6 to 8, and will he please bring the money with him)—is there anything incongruous in it? Similarly, when my second cousin Jimima stepped aboard the Green Star liner *Nulli Secundus* as a stewardess, did the heavens fall?

They—or it—did not!

My brethren, let us be just. Render unto Cæsar the things that are his'n, and do not deny my downtrodden sex the joy of accurate description.

I don't—thank God!—know anything about the Oxford Dictionary, but am prepared to pray that peace may abide with its ashes if it will call a lady who snaps, a snappess.—Yours, etc.,

DOLLY VARDEN.

LOW-PRICED CAMERAS.

SIR,—The woolliness "Simplicity First" finds in the work of expensive cameras is probably due to their owners feeling called upon to include clouds in their pictures with the aid of panchromatic films and colour filters.

One notices three striking points of difference in their cloud effects from what we see in nature; first, the "advanced workers'" skies are much too dark in comparison with the neighbouring clouds; secondly, he gets large areas of woolly white cloud, whereas real clouds of any size, unless very low and thin, are dark except at the edges; and, thirdly, he loses the natural light just above the sky-line. This is due to the over-correction of the blue part of the spectrum; as a result we pay more attention to the clouds than is natural—unless perhaps they are rain-clouds and we have no umbrella.

A second cause of woolliness is the excess of optimism with which the owner of the expensive miniature lays on the diameters when enlarging. It is true, enlargements from negatives taken with an expensive lens may show more detail than if a cheaper one were used, but brilliance is lost, and lines that should be hard become soft, and the lighter parts become woolly.—Yours, etc.,

EDWARD C. BARFIELD.

"The A.P." Monthly Competitions

AWARDS FOR JUNE.

ADVANCED WORKERS' SECTION.

First Prize.—"Cholesbury Mill (Bucks)," by Dr. S. D. Jouhar, 50, Crown Road, Twickenham, Middlesex.

Second Prize.—"Up Aloft," by F. J. Taylor, 11, First Avenue, Blyth.

Third Prize.—"Going to the Heaf," by J. C. Green, 24, Market Square, Brackley, Northants.

Mounting Prize.—"A Place in the Sun," by Arthur G. Dell, 88, Casewick Road, W. Norwood, London, S.E.27.

Certificates of Merit.—"The Scrum," by S. Lakshminarasu, 6, F. Street, Fort, Bangalore City, India; "Ricinus," by Ing. Carlos A. Pollitzer, Tucuman 811, Buenos Aires; "Out of the Night," by William Rambow, 12, Ingram Road, North Ormesby, Middlesbrough.

The prints not receiving awards have been grouped, those in the first group receiving Honourable Mention. The others have been marked Class 1 and Class 2 respectively.

Those awarded Honourable Mention are as follows:

(2) J. H. Clark (London, S.E.); (2) A. R. Elliott (Goole); F. N. Baker (Kirkella, Hull); G. Griffiths (Lytham); H. E. Haase (London, E.C.); R. C. Leighton Herdson (Herne Hill, S.E.); (2) William Jackson (Hull); (2) Dr. S. D. Jouhar (Twickenham); (2) S. Lakshminarasu (Bangalore); (2) Mrs. K. M. Parsons (Reading); (2) R. M. Roberts (Pinner); A. H. Roche (Ealing, London, W.); (2) E. G. Roughton (Romford); H. Bryce Thomson (Leeds); A. L. Syed (Palanpur, India); T. Y. Young (Soochow, China).

INTERMEDIATE SECTION.

First Prize.—"Journey's End," by James B. Brownlee, 13, Polworth Crescent, Edinburgh.

Second Prize.—"Floodlight," by H. Davis, Hathaway, West Drive, Harrow Weald.

Certificates of Merit.—"The Toilers," by C. R. Bailey, 3, Essex Road, Gravesend, Kent; "A Rabbit

Washing," by Dr. W. H. Du Pré, Tisbury House, Tisbury, Wilts; "The Winner of the 2.20," by Robert C. Morton, Forest Villa, Holborn Hill, Millom, Cumberland; "Stormy Sunrise," by Wilfred Turner, Southend, Westminster Road, Hale, Altrincham, Cheshire.

BEGINNERS' SECTION.

First Prize.—"Boat-makers at Lallaquich," by Miss Esmé Williams, 133, Cheyne Walk, London, S.W.10.

Second Prize.—"Radiance," by H. W. Buxton, 85, Warwick Street, Norwich, Norfolk.

Certificates of Merit.—"One Man and His Dog," by Leonard H. Gant, 3, Pond Chase, Shrub End, Colchester; "Wash-day," by J. A. Holdcroft, 900, High Lane, Great Chell, Stoke-on-Trent; "Peaceful Moments," by G. V. Peskett, 20, Nelson Road, Southsea; "The Mill," by Miss Margaret E. Storey, 27, Silverdale Road, Eastbourne.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, July 28th.

North-West London C.C. Meeting at 7.30 p.m.

Thursday, July 29th.

Camberwell C.C. Monthly Competition.
Hackney P.S. Outing to the Zoo.
Oldham P.S. "Mounting Prints." A. Birchenough.
Stretford C.C. Monthly Exhibition. Landscapes.

Friday, July 30th.

Folkestone C.C. "Colour Photography." J. Smith.
Photographic Society of Ireland. Informal Meeting.

Saturday, July 31st.

Manchester A.P.S. Hall i' th' Wood. T. Burton.
Stockport P.S. Broadbottom. Miss E. Wild.

Sunday, August 1st.

Ilford P.S. Latton Priory, Epping.

Monday, August 2nd.

N. Middx. P.S. Ayot and Wheathampstead.
Oldham Equitable P.S. Print Competitions.

Wednesday, August 4th.

Partick C.C. Receiving Date for Prints for Criticism.
Worthing C.C. Outing to Clapham Woods.

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

The Sixtus, Ombrux, and Blendux photo-electric exposure meters are the subject of a booklet just issued by Messrs. J. H. Dallmeyer Ltd., of 31, Mortimer Street, W.1. Of the three meters the Sixtus is both the smallest and the most sensitive, but it is also the most expensive. The Ombrux and Blendux meters are much alike, the main difference being that the latter is scaled for the ciné worker and the former for the "still" photographer. The booklet, which is fully illustrated with photographs and sketches, will be sent post free on receipt of a request to the above address.

Two new "Vauxhall" roll-film cameras have recently been put on the market by The Camera Company. Both are self-erecting cameras for pictures $3\frac{1}{4} \times 2\frac{1}{4}$ in., fitted with anastigmat lenses with front-cell focussing. The "Vauxhall Wonder" has an f/4.5 Vitar lens in a shutter speeded 1/25th to 1/100th sec., Bulb and Time, and is priced at £2 15s. 6d., or at £2 19s. 6d. if equipped in addition for half-size pictures. The "Vauxhall de Luxe" is a more ambitious instrument fitted with an f/3.8 Trinar lens in a Compur delayed-action shutter to which is fitted a special plunger release which is considerably more convenient of access than the usual trigger. This model, which is illustrated here, is priced at £5 17s. 6d. Further details of these cameras can be had on application to The Camera Company, at 320, Vauxhall Bridge Road, S.W.1, or at 52, Cheapside, E.C.2.

which, together with an improved method of loading the sensitive plates into the Compass envelopes, ensure that they work smoothly in the camera. The back has also been adapted to take a roll-film attachment, which is now available. Messrs. Compass Cameras Ltd. offer the owner of any original Compass, which does not embody these improvements, one of the revised series in free exchange for it. The exchange can be effected either through the dealer from whom the original camera was bought, or direct with Compass Cameras Ltd., 57, Berners Street, London, W.1.

The latest 21s. award in the Wallace Heaton "Babies" Competition was made to Mr. H. A. Godfrey, 131, Lytton Road, Stechford, Birmingham, 9, for his print entitled "Two Weeks." Full particulars regarding these weekly competitions for readers of "The A.P." appear regularly in our advertisement pages. At the request of many of our overseas readers, who are at present debarred from entering the Wallace Heaton competitions, we are able to give the dates and subjects of the remaining competitions in which it may be possible for them to enter. They are as follows: July 28th to August 11th, "Sunbathing." August 18th to September 1st, "Happy Holidays." September 8th to September 29th, "Travel Snaps."

The Yeovil Photographic Society, which was officially inaugurated on Wednesday, 14th July, by Mr. P. W. Petter, appears to be somewhat in the nature of a promising venture. At the opening Mr. S. Bridgen, representing Ilford Limited, gave the fifty members present a talk on "Landscape Photography." The society has rented a vacant house, which contains a lecture room, dark-room, and a room where prints may be exhibited. Upstairs there is a well-equipped room for the ciné enthusiasts, another installed with two enlargers, while a further room has been kept as a social room, furnished with numerous journals, books, and a radio set. The premises are situated at 11, Hendford, Yeovil, in the centre of the town. The Hon. Secretary, Mr. J. G. Milner, 1, High Street, Yeovil, will be very glad to welcome any new members.

We would draw the attention of our readers to the fact that Mr. F. E. Haynes, the Hon. Secretary of the Western Counties Photographic Federation, has changed his address, which is now 71, Cromwell Road, St. Andrew's Park, Bristol, 6.

The South Shields Photographic Society now has a new secretary, Mr. D. R. Morris, 10, South View Terrace, South Shields, who informs us that he will be very pleased to welcome any new members, or send any information to amateur photographers in the district who are contemplating joining a photographic society.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

85. Makers' Formulæ: Developers for Criterion Papers—(1)

Developer for Press Bromide Paper.

Metol	20 grs. (2.25 grm.)
Hydroquinone	40 grs. (4.5 grm.)
Sodium sulphite (anhydrous)	220 grs. (25 grm.)
Sodium carbonate (anhydrous)	164 grs. (18.5 grm.)
Potassium bromide	30 grs. (3.4 grm.)
Water	20 oz. (1,000 c.c.)

If crystallised carbonate and sulphite are used, take 440 grs. (50 grm.) of each.

The above developer is specially recommended for Criterion Press paper. It should be used undiluted, and development should be complete within 2 mins. at 65° Fahr. Rinse before fixing.

For Non-Stress Bromide and Bygas Papers. M.Q.

Metol	20 grs. (2 grm.)
Sodium sulphite (anhydrous)	360 grs. (37.5 grm.)
Hydroquinone	40 grs. (4 grm.)
Sodium carbonate	178 grs. (18.5 grm.)

Potassium bromide	20 grs. (2 grm.)
Water to	20 oz. (1,000 c.c.)

If using crystalline salts, take 720 grs. (75 grm.) of sulphite and 480 grs. (50 grm.) of carbonate.

Amidol.

Sodium sulphite (anhydrous)	240 grs. (25 grm.)
Potassium metabisulphite	60 grs. (6 grm.)
Potassium bromide	10 grs. (1 grm.)
Water to	20 oz. (1,000 c.c.)

If the above solution is made up with crystalline sulphite, take 480 grs. (50 grm.). Just before use, add 3 grs. amidol to each ounce (0.3 grm. to each 50 c.c.) of the above stock solution.

Either developer should be used at 65° Fahr. Bygas should be developed for 45 to 60 secs., and Non-Stress Bromide for 1½ to 2 mins.

Bygas should not be rinsed before fixing. The M.Q. developer is available in packet form.

A new and improved model of the Compass camera is announced and owners of this attractive "miniature" should note how they may benefit by the modifications and additions that have been introduced to enhance the value and utility of the little instrument. In the latest model the fundamental design remains unaltered, but a new lens has been fitted. We understand that only a slight modification of the original formula has been used, but it results in notably finer definition and better covering power. The mechanism of the shutter is altered to give even greater reliability, and a new mounting has been designed for the range-finder. Some slight but important alterations have been made in the camera back,

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a separate stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Photo-Electric Meter at Night.

In using a photo-electric meter for portraits, copying, etc., by artificial light, do I expose according to the indication given by the meter, or do I multiply by some factor depending on the distance? J. L. (Nottingham.)

In using a photo-electric meter by artificial light you should give about three times the indicated exposure if you are using orthochromatic plates, but if you are using panchromatic plates you can give the exposure shown by the meter. The speed number taken for the plates should be the same as that which you have found by experience gives you satisfactory negatives when working out the exposure by daylight. Do not forget that the meter measures the total reflected light from all objects within its range; in estimating the exposure for a portrait against an unilluminated background the meter should therefore be brought close enough to the sitter to ensure that its field of view includes none of the background.

Cell Meter in Dim Light.

I have been told that when using a photo-electric meter in so dim a light that it will not read, a fairly good result could be obtained by pointing it at the light instead of at the subject, and multiplying the reading obtained by 30. Is this the case, please? J. O. F. (York.)

The use of an electric exposure meter by pointing it towards the source of light and then multiplying the reading by a factor is a very satisfactory means of enabling the meter to be of service in lighting conditions that are otherwise too dark for it. You must realise, however, that in this use of the meter you are no longer measuring the light reflected from the subject, but that falling upon it, and that, while it may be sufficient to multiply the indication of the meter by 10 if the subject being photographed is light in colour, it might be necessary to multiply it by as much as 50 if the subject were dark.

Stereoscopy in Colour.

Wishing for a change from ordinary photography, I have recently been doing some stereoscopic work. Now I am wondering whether it would be possible to produce stereoscopic slides in colour, which should give the nearest approach to reality that the photography can provide. Is this possible? And is there any general advice that you could give me? W. S. J. (Plymouth.)

Coloured stereoscopic views have been made since the early days of the Autochrome plate, so you need have no doubts as to their possibility. If plates are used they have to be cut with a diamond and transposed, but if colour films, such as Dufaycolor, are used, they can easily be cut with scissors. It is not possible to give you much useful advice within the limits of a reply, but if you are seriously interested in stereoscopic work, we think it would be worth your while to get a copy of "Practical Stereoscopic Photography," by F. M. Dalzell, price 10s. 6d., and published by Messrs. Henry Greenwood & Co., Ltd., 24, Wellington Street, Strand, London, W.C.2.

Photo-Electric Meters.

Can you tell me how a photo-electric exposure meter works? W. H. M. (Somerset.)

A photo-electric exposure meter contains a cell which generates on an electric current, the intensity of which is proportional to the intensity of the light falling on the cell. This current is registered by a sensitive electrical instrument, so that the movement of the pointer of this is a measure of the amount of light entering the exposure meter.

The movable scales on the meter then calculate for you what actual time of exposure is required, for any speed of film and any lens aperture, to record satisfactorily on the film a subject reflecting this amount of light.

Moving Objects and Distortion.

I hope to attend a race-meeting next week, and shall attempt some broadside-on views of the racing horses, using a focal-plane shutter. In which direction relative to the moving image should the slit of the shutter travel?

T. W. G. (Nottingham.)

No matter which way the slit of a focal-plane shutter travels, the image of a moving object will be distorted. It is generally considered best to have the slit travelling in the opposite direction to the movement of the image on the film, as, in this case, the distortion takes the comparatively harmless form of a slight shortening of the object in the direction of its motion.

Do not forget that, if the object is travelling from right to left, the image is moving from left to right.

Identifying a Camera.

I recently purchased a second-hand roll-film camera, and am anxious to know the name of the makers so that I can write to them for a portrait attachment for it. All details of lettering, etc., on the camera are enclosed. W. J. W. (Canterbury.)

All the details you give are marked on the lens and shutter, and as the same lens and shutter can be, and often is, fitted to a dozen different cameras by a dozen different makers, your information is of no help in identifying the camera.

This, however, is fortunately of no importance for your purposes, as any make of portrait attachment which is a reasonably good fit on the lens will be perfectly satisfactory. Except in one or two cases, these auxiliaries are not designed for any special lens, but work equally well with any.

Films and Filters Abroad.

I am going to Switzerland this month and should be glad if you would advise me how to get the best out of my camera. I normally use Verichrome film, but I am given to understand that the different light values necessitate a faster film.

G. F. H. (Surbiton.)

We very strongly recommend you to keep to the film that you usually use, as familiarity with the material you employ is a great help in obtaining consistent results. A holiday, where every exposure will be valued, is the worst possible time for experimenting. With, perhaps, one exception; we would strongly suggest that you take with you a yellow filter, even if you do not normally use one, as this will enable you to get tone in a blue sky.

Printing from Paper Negatives.

I have been asked to make some prints from a paper negative, and have no idea how it is done. Can you help me, please?

E. R. G. H. (Newport.)

The card negatives to which you probably refer are intended to be printed from by professional firms, who alone have the necessary suitable apparatus. If you have a double-extension plate camera you can load a slide with bromide paper, put the negative up in a good diffused light, and copy it. The bromide paper will develop up as a positive print.

DON'T RISK IT!

After all the trouble you have taken in obtaining your holiday pictures, it would be heart-breaking to have scratched and dirty negatives returned to you ; under-developed negatives, or over-developed negatives ; insufficiently fixed negatives, or negatives fixed so long that the high-lights are killed ; negatives stained from insufficient washing, or negatives blotchy from careless drying ; negatives reticulated ; negatives grainy ; negatives, in a word, awful !

Really, why risk all this ? Even if you haven't found out yourself, your friends have probably told you that R. G. Lewis-processed films are a joy and a delight to the eye ; why, then, entrust your films to the tender mercies of an inferior service when you know that any work sent to us is given to an experienced technician who really knows his business. It seems almost incredible, but our developing staff are so enthusiastic that they spend a great deal of their leisure time in experimenting with fresh developers, new tanks, new fixers, new stop-baths, and anything else on which they can lay their eager hands ! We subsidise their investigations as their discoveries are making our developing and printing department a really matchless institution !

There are, incidentally, two recently introduced innovations which we have not announced before. These are :

We will undertake the processing of Leica size films in Champlin 15 at the standard charge of 3s. 9d. for special Correx tank development, or 3s. for V.P. and 120 films. No increase in exposure is necessary, and even badly under-exposed negatives come up smiling. The grain is extremely fine, and the gradation brilliant, the results being almost the equal of those obtained with a three to four times' exposure increase and Sease I developer.

Contact strips. We have discontinued the old "contacts in pairs" system, and the modern method is to print the complete roll on one long strip of bromide paper—matt or glossy as required. As will be realised, this system is better than anything else yet devised for filing purposes, quite apart from the beauty of the roll itself. The price per roll is the very reasonable one of 2s. 6d.

We feel that it is almost a waste of time to mention our enlarging technique, as this is so famous by now that any comment can only be superfluous. However, we don't want our enlarging staff to feel "left out in the cold," hence this short note about them. Their work has to be seen to be believed—and even then it sometimes seems hard to believe that they can turn out such wonderful work as they do.

Have you received your copy of the "New Technique of Miniature Film Processing" ? If not, why not ? Write to-day for a copy, and learn what wonderful service we can offer ! "Try 202 for Service !"

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1

(HOLBORN 4780).

(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

Put COLOUR into your next pictures

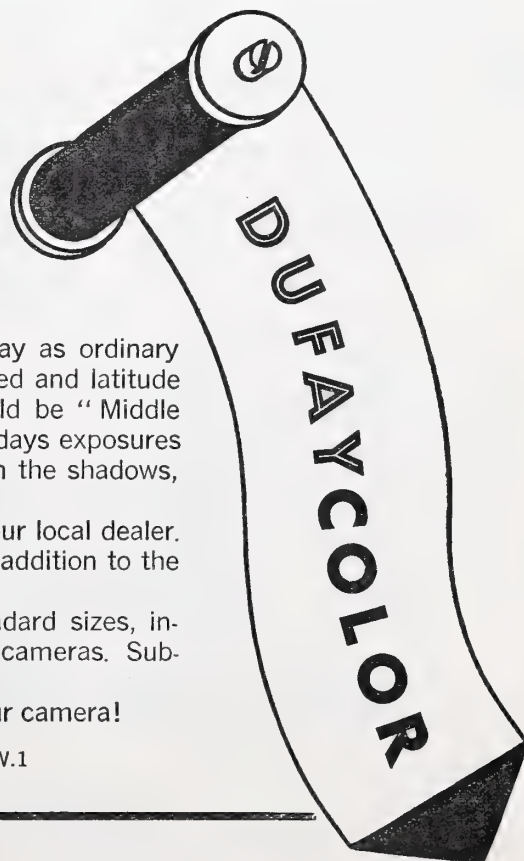

You load and expose the film in exactly the same way as ordinary stock. No filters are necessary. No attachments. Speed and latitude are both good. For example, a typical exposure would be "Middle of the day; July; sunshine; 1/25 sec at f.8." On dull days exposures are relatively longer, but the recorded colours, even in the shadows, are still crystal-clear and crisp.

Development and finishing are done by us, through your local dealer. Any number of black-and-white prints can be made in addition to the original colour transparency.

Dufaycolor films and packs are obtainable in all standard sizes, including 35 m.m. film for Leicas and similar miniature cameras. Sub-standard cine film (used with filter) is also made.

Put life in your next pictures. Put DUFAYCOLOR in your camera!

DUFAY-CHROMEX LTD 14-16 COCKSPUR STREET LONDON S.W.1

Grain & Gradation

in your negatives

For **FINEST GRAIN** in miniature films use

Johnson's FINE-GRAIN DEVELOPER

NO WEIGHING. NO MESS. NO MISTAKES.
20-oz. tins, complete with development tables, price 1/-

For Perfect **GRADATION** in roll films use **AZOL** THE CORRECT DEVELOPER

and develop according to the AZOL Time and Temperature Tables.

3-oz. bottle makes 75 to 300 oz., 2/-.

Manufactured by
Johnson & Sons, Manufacturing HENDON,
Chemists, LTD. LONDON, N.W.4

**You don't know
how good an
inexpensive
camera can
be—till you've
seen this**

**Voigtlander
BRILLIANT**

SCHERING LTD. (Voigtlander Dept. A), 185/192, High Holborn, London, W.C.1

● 12 pictures for the price of 8—and you see them crystal-clear and practically **FULL SIZE** while you take them! Those are the two features that have made the Voigtlander Brilliant famous. Using standard 8-exposure $3\frac{1}{2} \times 2\frac{1}{2}$ film it gives you **TWELVE** pictures $2\frac{1}{2}$ in. square. Think what that will save you! And you're certain of good results because the full-size view-finder makes composing and taking simple. Made by the world-famous firm of Voigtlander—optical craftsmen since 1756—the Brilliant offers truly remarkable value at its price. Ask your dealer to demonstrate it, or write below for full details.

45/-

With genuine Voigtlander VOIGTAR F/7.7 Anastigmat lens, speeded shutter, 3 point focussing. Other models from £3 15s. to £6 15s.

★ There's the same fine value with **ILLUSTRA FILM**

★ **VOIGTLANDER FOR VALUE** ★

THE SCOTTISH Miniature Specialists

You should try our miniature processing and our enlarging. We make the enlargements on the kind of paper you like best, and they are not made automatically.

When you want to change your camera let us know, we are sure to be able to satisfy you.

When it comes to DEVELOPING & PRINTING your pictures

Send your films to Will R. Rose Ltd. Their staff of highly skilled specialists all share the Will R. Rose enthusiasm for quality. In their developing department they aim at bringing out every detail—only fine developers are used, and in the printing department they are using a new special paper that gives the negative its full value.

"Magna Prints" (regd.)

Unless otherwise ordered, V.P.K. and No. 2 Brownie films are printed the "Magna" way—magnified to 4½×3½ in. and cost only 2½d. each. "Magna" Prints from miniature camera negatives are the standard price of 3d. each.

PRACTICAL HINTS

Soft light on the subjects makes a better snapshot.

HOW TO SEND YOUR FILMS

Wrap your spools securely (envelopes are not safe)—remember to enclose your name and address. Prices standard throughout.

Send your next spool to

WILL R. ROSE Ltd. (Dept. A.B.)

23 Bridge Street Row, CHESTER

133/134 High Street, OXFORD 25 The Promenade, CHELTENHAM

DID YOU KNOW . . .

THAT THE

"TRANSPAROL" CORNERS

Packed in Boxes of
100. Price 6d.

From your dealer, or catalogue post free from Sole Importers :

R. F. HUNTER, LTD., Celfix House

51, GRAY'S INN ROAD, LONDON, W.C.1. Phone : HOL. 7311/2.

are the very thing for your album. They do away entirely with messy paste, yet they allow all the print to be clearly viewed. Made of best materials, they will remain firmly in position, yet allow the print to be taken out if required. Especially suitable for contact prints of miniature negatives, as they cut off no portion of the print.

FOR THE MINIATURE MOB—

ENLARGEMENTS

par excellence from your
Miniature Films! Individual
attention for each one by

Zeiss Triotar f/3.5. £16 10 0

Detailed list of these cameras, post free.

SANDS HUNTER & CO. LTD.
37, BEDFORD ST. STRAND, WC2

LOOK AHEAD

She'll enjoy seeing this movie at her 21st birthday party!

That's the reason why you should be making your films now with a Paillard cine camera.

You'll be glad in after years that you did your filming with a first-class instrument—it will be too late then to go back and re-film faces and places which have changed.

If a subject is at all filmable, the Paillard will take it, because it has the biggest range of refinements ever before available in one sub-standard instrument.

Refinements include:—Critical visual focuser. Special tri-focal view-finder giving parallax correction down to 2 ft. In spite of its compactness, the turret head has wide spaced lenses so that the field of wide-angle lenses (F 15 mm.) is not interfered with by telephoto lenses. Variable speeds—8 to 64 and all intermediate. Mechanism starts off at exact speed set, avoiding over-exposed frames at change of scene. Counter of high precision. Possibility of filming backwards for whole length of 100 ft. film being taken up and the counter subtracting exact amount (indispensable for superimposition, lap dissolves, etc.). Total disengagement of motor, even when fully wound. Picture-per-picture device, "time" and instantaneous exposures from 1/10th to 1/50th sec. Takes 50 and 100 ft. spools, any make.

Obtainable in three models for 9.5-mm., 16-mm. and double-8 films. With critical visual focuser and Dallmeyer f/1.5 speed anastigmat lens. £55 0 0

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 28a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

FAMOUS NORFOLK CAMERAS.

SHEFFIELD PHOTO CO. LTD.

NORFOLK ROW, (FARGATE)

SHEFFIELD — One minute walk from Town Hall

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **ILIFFE & SONS LTD.,** and crossed

Notes being untraceable if lost in transit should not be sent as remittances.

& Co.

IMPORTANT NOTICE

Owing to the August Bank Holiday, the next issue of "THE AMATEUR PHOTOGRAPHER AND CINEMATOPHAGRAPH" (dated August 4th) is closing for press earlier than usual.

In accordance with the Notice that appeared last week, the latest date upon which Miscellaneous Advertisements could be accepted for the above issue was **FIRST POST, WEDNESDAY, July 28th.**

ENSIGN

'CLIP-ON' DIRECT-VISION OPTICAL VIEW-FINDER

Fits ANY Camera

For $2\frac{1}{4} \times 3\frac{1}{4}$ or TWO-ON $2\frac{1}{4} \times 1\frac{1}{8}$ size pictures. Can be instantly attached to all types of folding cameras by means of a spring clip. It only measures $1\frac{1}{4} \times \frac{1}{2} \times \frac{3}{4}$ in., and can be slipped into the waistcoat pocket when not in use. The detachable cover is provided with two mask sizes; the larger size, $2\frac{1}{4} \times 3\frac{1}{4}$ in., at one end, the smaller size, for $2\frac{1}{4} \times 1\frac{1}{8}$ in., at the other. The change from one to the other is effected simply by gripping the cover at both ends, lifting off and reversing.

Price 6/6

UNIVERSAL BALL-AND-SOCKET HEAD

Enables a camera to be set at any angle. Also for using the tripod for supporting the camera in a vertical position for such work as photographing pages direct from books, small objects, coins, maps, and any object which comes within its range.

For use with any camera 3/6

Midget pattern. Very compact 3/-

New 1937 SUPER-BEWI Photo Electric Exposure Meter

With extra-sensitive everlasting photo cell and combined optical meter for still or cine. Can be carried in the waistcoat pocket without difficulty. Measures weak interior light by means of a built-in optical meter. Shows at a glance diaphragms from f/1.4 to f/36, and from 1/3,000 sec. to 1 hour. No calculations. Suitable for all negative emulsions. Fitted with depth-of-focus scale.

THE VAUXHALL MINICAM

TAKES 12 OR 16 PICTURES ON STANDARD 3½ x 2½ FILM. FINEST MOROCCO LEATHER COVERING

Constructed of Metal—NOT Bakelite.

Everybody, including the Press critics who have seen and tested the new all-metal Vauxhall Minicam, are amazed at the value. This low price is only possible because of the fact that we as sole distributors, import large numbers direct from the factory in Germany, and, in addition, we are content to sell at a small profit. If you purchase a Vauxhall Minicam you will be saving approximately 50 per cent against the price of its nearest competitor.

2½ square or V.P., f/2.9 anastigmat, **£6:19:6**
 Compur shutter **£5:19:6**
 (Or under our Self-Financed Hire-Purchase Terms of 12 monthly payments of 12/3).

Ditto, with Prontor II shutter. **£5:19:6**
 (Or under our Self-Financed Hire-Purchase Terms of 12 monthly payments of 10/6).

NEW 3½ x 2½ MODELS

TAKES 8 3½ x 2½ OR 16 2½ x 1½ PICTURES. FINEST MOROCCO LEATHER COVERING

F/3.8 anastigmat in D.A. Compur shutter. **£5:17:6**
 Ditto, with radial focussing. **£6:17:6**
 F/4.5 anastigmat in 3-speed shutter. **£2:19:6**

CASH, EXCHANGE, OR DEFERRED TERMS.

The "PHOTO GUIDES" are entirely different from all other photographic handbooks. They contain original and unique illustrations and the text is written in a new and attractive style. Each "Photo Guide" deals with one aspect of photography. The information will be found interesting and useful.

Price 1s. 1d. each, or post free 1s. 3d. The four books, 4/6 post free.

1. "A GOOD PICTURE EVERY TIME" explains the rules that govern pictorial composition, tells you how to make every snap an "exhibition" picture.
2. "SHARP-FOCUS/ACCURATE EXPOSURE" gives you easily understood and easily remembered rules for deciding the correct setting of distance scale, lens aperture and shutter time.
3. "130 PHOTO FAULTS" covers every stage of photography from camera-loading to enlarging, giving the cause and cure for every fault that's ever worried you—or ever likely to.
4. "TAKING PICTURES AT NIGHT" will convince you that your camera is capable of incredible achievements, will show you how perfect night pictures can be secured with even the smallest, simplest camera.

Brighter Photography

By DAVID CHARLES, F.R.P.S.

The carefully arranged chapters cover the whole field from the choosing of a camera to developing and printing the finished picture. There are important sections dealing with Focussing, Aiming the Camera, Photographic Groups, Lighting and Exposing, and over one hundred and sixty illustrations, each numbered and each conveying a really useful hint.

GOOD ALLOWANCE ON YOUR USED CAMERA
IN PART EXCHANGE FOR A ROLLEICORD.

THE ROLLEICORD SPECIALISTS . . .

With the years of experience I have had in marketing cameras, I can say quite sincerely that I have not yet met better value than the new Rolleicord Model Ia at £12:10:0

Wallace Heaton

ROLLEICORD Ia. Takes 12 pictures $2\frac{1}{4} \times 2\frac{1}{4}$ on $3\frac{1}{4} \times 2\frac{1}{4}$ 8-exposure roll film for 1/-. Shows the picture FULL SIZE, right way up, to and during exposure.

Full provision for parallax compensation. Automatic film wind making overlapping of exposures impossible. Depth of focus and focussing knob combined. F/4.5 Zeiss Triotar lens. Engraved exposure plate at back of camera. Strong rigid metal body covered in art leather. One lever Compur shutter speeded to 1/300th sec., T. and B. Great versatility with the addition of Rolleiflex accessories, all of which it takes except the angle mirror. **£12:10:0**

24 MONTHLY PAYMENTS OF 11/3
or 15 monthly payments of 17/6.

Confidential — without harsh enquiries — easiest of all.

"SUNBATHING" PHOTOGRAPHIC COMPETITION

A TOPICAL "SUNNY DAYS" SUBJECT THAT MAY WIN YOU A GOOD CASH PRIZE

Sunbathing is the fashion nowadays, and you'll not find it difficult to find material galore for your pictures. At the seaside, of course, is the best place—but not the only place. What about your local lido—or the banks of the Serpentine, or in your back garden? See what you can do! There's cash for you if your photography is the best, and the rules are as simple as A.B.C.

THIS COMPETITION IS OPEN TO AMATEURS ONLY, BUT ANY CAMERA OR MATERIALS CAN BE USED.

Results are published each week on The A.P. "News and Reviews" page.

Last week's prize-winner was Mr. A. G. Dell, 88, Casewick Road, West Norwood, S.E.27.

THESE ARE THE RULES:

- The period of this competition is July 1st, 1937 to September 30th, 1937. Amateurs only are eligible. Write name and address, title of picture and attach a Wallace Heaton Competition Coupon to the back of each entry. You can use any make of camera or materials and it is immaterial who develops, prints and enlarges your negatives. Entries may be any size, mounted or unmounted (not less than 8x6 unmounted is recommended). All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. No retouching, composite printing or faking allowed. Only simple spotting to remove pinholes, etc.
- WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, (If a guinea prize-winner for an extra guinea.) OR THE RIGHT OF ONE REPRODUCTION FOR 10/6.
- Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.
- If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made and no entries will be returned unless above is complied with.
- Acceptance of these rules, etc., is a specific condition of entry.
- A selection of the best entries will be held back at the close of the competition for exhibition in our galleries prior to their return.
- Our gallery is always interesting—call and see it when in Town. Free, of course.

WALLACE HEATON LTD.
127, NEW BOND STREET, LONDON, W.1

for the
best
photograph
submitted during the
run of the competition
£25
will be awarded

**THERE IS ALSO A
WEEKLY PRIZE of 21/-**

WALLACE HEATON COMPETITION COUPON

To be affixed to each entry. Valid until Competition closes on September 30th, 1937.

Enclosed is my entry for "....." Competition.

I agree to the rules and conditions.

No Mystery About it . . .

There is no mystery of any kind about the Westminster facilities for Buying Out-of-Income; no hidden factors whatever; no third parties in the background; you deal direct with the Westminster—and no one else. The whole business is carefully made as expeditious, simple, and friendly as anyone can possibly desire. The *friendliness*, moreover, affords you the valuable and important 'customer protection'—as a *right*, in case you need it; it extends to you too, a wide latitude that enables you to fix the terms that suit you best, and further it affords you specially favourable facilities—if you wish to *Part Exchange* your present camera, and settle the balance due on the new one by very easy instalments. It always pays to part exchange at the Westminster.

The 'WESTMINSTER ANNUAL' (nearly 180 pages)

Ask for it, at any of 'the Four Westminsters,' when your next passing. Otherwise you have only to write a postcard. Sent anywhere, with pleasure, post free.

ENSIGN SELFIX

Takes 16 pictures $2\frac{1}{4} \times 1\frac{1}{4}$ or 8 full $3\frac{1}{4} \times 2\frac{1}{4}$ on standard spool. TAKE A Rolleiflex*

**AND COME BACK WITH A SUPERB
COLLECTION OF HOLIDAY PHOTOGRAPHS**

Simplicity in use—Superlative results—those are the reasons why the Rolleiflex is ideal for holiday photography. You can compose and focus your picture, adjust your aperture and shutter speed all at the same time. Your picture, being full size and right way up, is big enough even to allow you to see changing facial expressions—and tells you exactly when to snap. Gives 12 pictures $2\frac{1}{2} \times 2\frac{1}{4}$ on $3\frac{1}{4} \times 2\frac{1}{4}$ roll film for 1/-, which can be obtained everywhere, and special development is not necessary. One-lever Compur-Rapid shutter, speeded to $1/500$ th sec., T. and B. Zeiss Tessar $f/3.5$ lens.....£25

Your dealer will be pleased to demonstrate the Rolleiflex, or prospectus will be sent on request from the Sole Importers:

WEDNESDAY, AUGUST 4TH, 1937.

Copyright—Registered as a Newspaper
for transmission in the U.K.

VOL. LXXXIV. No. 2543.

WE hope that our many readers who are on holiday have not overlooked the imminence of the sending-in dates for the autumn exhibitions. This particularly applies to the Annual Exhibition of the Royal Photographic Society. The sending-in day for this is Friday, August 13th, and entry forms and prints must reach the Secretary, The Royal Photographic Society, 35, Russell Square, W.C.1, not later than that date. As previously mentioned, the Exhibition is in six sections: (1) Pictorial, (2) Colour, (3) Scientific and Technical, (4) Natural History, (5) Stereoscopic and (6) Press, Theatrical, Commercial and Advertising. Medals will be at the disposal of the judges in all sections with the exception of classes (1) and (2). The Exhibition itself will not be opened until Saturday, September 11th. Entry forms are obtainable from the above address or from the office of "The A.P."

Litter.

Lovers of the countryside have at times been antagonised against the amateur photographer on account of the tendency of some of the more thoughtless to leave very obvious traces of their passage in the form of litter. We have, on occasion, noted torn pull-outs of film-packs, and outer wrappings, empty film cartons and tinfoil, etc., scattered in the neighbourhood of well-known beauty-spots, all indicative that snapshot cameras have been used there recently. We know that readers of "The A.P." do not do that sort of thing, but it is well to note that there is, at present, a "Banish the Litter" campaign, which is being brought to the notice of holiday-makers in many parts of

TOPICS of the Week

THE SUMMER SEA.

An article referring to exposures at the seaside appears elsewhere in this issue.

the country and we feel that amateur photographers should be specially careful not to be included in a condemnation that is more particularly directed against the "tripper" generally. The wrappings of photographic material, etc., when finished with should always be collected and carried away. Film-pack tabs are just as easily put in the pocket as dropped on the ground, and film cartons should be kept in any case to hold exposed films. We are reminded of the matter by the action of Messrs. Agfa Photo Ltd., who are making an appeal to that portion of the public who use their films, and to all others. As they point out, few people appreciate more than the amateur photographer the beauties of our countryside, and they, in particular, if film users, should co-operate in this "Banish the Litter" campaign and help thereby towards the elimination of a rapidly increasing evil.

A Jealous Eye.

Why exactly the posters which announced Navy Week should add among the list of attractions designed to lure visitors that "No cameras will be allowed," we do not pretend to know. It is not exactly an attraction to be told to leave one's camera behind. No one, of course, complains of all proper precautions against the disclosure of secrets which might be prejudicial to the country. At the same time, the eye of evil intent can reap unaided quite as effective a harvest as the camera. Some authorities—we are not speaking of the Admiralty in particular—seem to have quite an exaggerated idea of what the camera will accomplish. It might be supposed that a chance snap would give

the whole show away. We hate to destroy one of the cherished illusions of writers of fiction, but we should say that it is the very rarest thing for any photograph taken casually to convey any information of value; it is different, of course, with photographs taken deliberately by technical people with a view to illustrating the details of machinery and the like. But when Dockyards are thrown open to the public, secret matters are not left about for the inspection of all and sundry.

Exploration by Camera.

The British Graham Land Expedition has just returned to England after three years' isolation from the rest of the world, and the fact that they were able to map nearly a thousand miles of Antarctic coastline from the air proves once again how vital an asset the camera has become to the explorer. Everest may still be unconquered, but it is already four years since it gave up its secrets to the aerial camera. Huge tracts of African jungle, im-

penetrable by foot, have been surveyed by the same method, and gradually the aerial camera is filling in the last remaining blanks on the world's map. In all these scientific achievements, it is well to know that British men and British equipment are playing their full part. Most of the important surveying work in the Empire is now carried out with British aerial cameras, which we understand have been supplied by Messrs. Williamsons, of Willesden.

"The Amateur Photographer" EXPOSURE TABLE—August

EVERY MONTH a brief exposure table will be provided for the assistance of our readers in their practical work. A glance at the current approximate exposures as here given will serve as a reliable guide for most purposes. The subjects will be varied to suit the time of year. The following exposures will serve as a working guide for any fine day during the month, between the hours of 9 in the morning and 3 in the afternoon, with the sun shining, but not necessarily on the subject. Stop used, f/8. The exposure should be doubled if the sun is obscured, or if stop f/11 is used. For f/16 give four times the exposure. For f/5.6 give half. From 8 to 9 a.m. or from 3 to 4 p.m. double these exposures. From 7 to 8 a.m. or from 4 to 5 p.m., treble them.

N.B.—The times given above are by "sun time." The exposures, therefore, which are laid down as suitable for 3 to 4 p.m., for instance, will be those to be given between 4 and 5 p.m., by the clock, during "summer time."

SUBJECT.	Ultra-Rapid.	Extra-Rapid.	Rapid.	Medium.	Ordinary.	Slow and Process.
Open seascapes and cloud studies ..	1/700 sec.	1/500 sec.	1/300 sec.	1/50 sec.	1/75 sec.	1/30 sec.
Open landscapes with no very heavy shadows in foreground, shipping studies or seascapes with rocks, beach scenes ..	1/350 "	1/200 "	1/150 "	1/75 "	1/30 "	1/20 "
Ordinary landscapes with not too much foliage, open river scenery, figure studies in the open, light buildings, wet street scenes ..	1/200 "	1/150 "	1/75 "	1/30 "	1/20 "	1/10 "
Landscapes in fog or mist, or with strong foreground, well-lighted street scenes ..	1/150 "	1/75 "	1/30 "	1/20 "	1/10 "	1/6 "
Buildings or trees occupying greater portion of picture ..	1/50 "	1/20 "	1/12 "	1/8 "	1/4 "	1/2 "
Portraits or groups taken out of doors, not too much shut in by buildings ..	1/20 "	1/10 "	1/5 "	1/3 "	3/4 "	1½ "
Portraits in well-lighted room, light surroundings, big window, white reflector ..	1/8 "	1/4 "	1/2 "	1 "	2 secs.	4 secs.

As a further guide we append a list of some of the best-known makes of plates and films on the market. They have been divided into groups, which approximately indicate the speeds referred to above.

Seaside and Inland Light

In several very important respects photography, on or near the sea, differs a good deal from that at inland places. The following article draws attention to the dissimilarities and their effect on exposures.

ONE of the things that will occur to the photographer who uses his camera at the seaside for the first time is the fact that changes in the quality and strength of the light take place in general much more rapidly, and also show greater extremes than those occurring inland at the same latitude and at the same season of the year.

For example, the sea occasionally wears a most dreary appearance with sea and sky of leaden hue, but, when the conditions are at the other extreme, there is a brilliance in the very air that seems much to exceed anything we find at places inland; and yet the change from the first extreme to the second, or vice versa, may take place in a very short time.

The brilliance of light at sea, compared with that found inland, perhaps only a few miles away, is a result, firstly, of the absence of impurities in the atmosphere above the sea, and, secondly, of the light reflected from the water. Smoke and dust particles are almost wholly absent from the sea atmosphere, whereas, at inland places, they are always rising and spreading through the air.

Effects of Dust and Smoke.

Dust and smoke particles are disadvantageous to the photographer for another reason; they are nuclei on which vapour can readily condense in the form of drops, thus forming mist and low cloud, which absorb and scatter much of the light.

Where smoke, dust, and moisture particles are absent from the atmosphere the sun's rays are not considerably disturbed when passing through it, but, where there is an appreciable quantity of such particles, the rays are much broken up by reflection and irregular refraction, or, in other words, the particles scatter the light. And it is unfortunate for the photographer that the short light waves, more especially necessary for his purpose, suffer most by these obstacles.

It is true that there sometimes occurs at inland places an intensity of light approaching that found at sea; the conditions in question may be noted more often in spring and summer after some showers of rain (with large drops), which not only wash the dust particles out of the air, but also carry down and deposit the moisture.

The conditions of the different strengths of light found at the seaside can be conveniently grouped for photographic purposes as follows:—

Seaside Light.

(1) Beginning with the worst case, namely, sea mist, which, in extreme cases, can be as wetting as rain. The visibility is very short, and the light of little or no use for ordinary photography at ranges exceeding a few yards.

(2) Next in order of improvement is the dull overcast sky with moderate visibility in all directions; the sky, or rather the cloud mass, is light and dark in places, while the light over the sea appears to be coming and going slowly. In these conditions it is possible, by ordinary photographic methods, to obtain striking pictures, albeit of a rather gloomy texture, but, with the aid of suitable filters, the results can be much enhanced.

(3) Proceeding, we come next to the case in which the background of the sky is almost wholly bluish, or light greyish blue, with a considerable amount of fleecy wisps and masses of white cloud. Good work can be assured in these conditions, which are almost ideal for picture-making, but the inexperienced photographer should be on his guard against sudden fluctuations in the strength of the light.

(4) The sky is blue all over without a vestige of cloud, and the sun a dazzling ball, the light is not only strong, but also true and steady. Perfect for high-speed snapshots, but likely to be productive of over-exposure and occasionally of hard shadows.

The Sea as Reflector.

Hitherto we have been considering light coming direct to an object from the sun, sky, or bright cloud, and it is now necessary to speak of the important part played by the sea as a reflector of light from those sources, and also the extent to which this influences photographic operations.

We take, in the first place, an instance which shows how an apparently minor change in the sky or cloud may produce a considerable alteration in the strength of the light falling on an object. Suppose we are in a vessel, or standing near the seashore on a very wet or dull day, the sky overcast with cloud of a uniformly drab tint; suddenly it seems to become a little brighter where we

are standing, or, on the other hand, some distant object appears as if slightly more light were being shed upon it.

What has caused this quick though apparently slight change? If we scan the pall of cloud it will be found that at some place or other it has become a little thinner; perhaps it is only a relatively small patch of sky that shows any increase of brightness. Nevertheless, the somewhat stronger light from this area of brighter cloud is reflected from a great area of the water surface, thus causing the increase of light on the objects about us, which we had noticed.

Deceptive Changes.

If exactly the same slight change in the appearance of the cloud had occurred when we were standing at some place far inland, we should hardly have noticed any increase of brightness, because there would not have been in that case any appreciable reflection from the ground.

It will readily be understood that the amateur who has had little or no experience of photography at or on the sea, will at first find it very difficult to estimate the strength of the light. He will often be deceived if he trusts the eye alone, and, on the whole, it is sound policy to assume that the light at sea is a good deal stronger than he imagines it to be, and he must guard against over-exposure.

Direct Reflections.

The water surface is a collector of light from the whole sky. If, for instance, on a clear day we look towards a surface of rippled water lying between us and the sun, we will notice that it is covered with innumerable sparkles and flashes. Those spots and lines of intense light mark the places on the surface which have momentarily taken a position such that the greater part of the light falling on them is reflected towards us. Also, when the sun has descended until it is at an angle of about 40 degrees with the water, and thereafter until it is but a few degrees above the horizon, an intense reflected light is thrown up in clear weather from a plain water surface. This would be sufficient to halve the exposure necessary for an open landscape subject taken at the same time.

T. W. MACALPINE.

The COUNTRY in SUMMER

By
F. READ.

A rest after toil.

THE call of the sea is such a dominant note at this time of the year that the charms of a jaunt into the countryside are apt to be overlooked by the camera worker. Yet the country has just as much to offer the photographer in the summer in return

for a little attention as at any other season, and the pictorialist who has had a satiety of rolling waves, paddling children and other excitements of the beach will find a welcome change in the peaceful quiet of country lanes.

Incidentally many delightful country scenes full of material for picture-making are frequently within a short distance of the coast.

Here the only noise may be the twittering of the birds and the only life the disappearing tail of a venturesome rabbit—a welcome change from the noise and bustle of

the seaside. And though the trees have lost the freshness of their spring-time garb, there is yet a restfulness in their leafy masses that soothes a jaded town-worn soul and beneath their welcome shade a refuge from the heat.

The photographer must be prepared for a different type of picture. The countryside, with its changeless fields and unending lanes, can provoke some spirits to desperation by its seeming monotony, but the genuine lover of nature, blessed with a discerning eye, can find everywhere something of interest and if not of great beauty at least worthy of an exposure.

Landscape work is out of favour with many workers

The Lone Worker.

who seek only the "modern" viewpoint, but a good landscape can still, if handled with wisdom, result in an exhibition picture of enduring charm. There is life also to be found. The farmer's year is now reaching its climax, and the cornlands are agog with the bustle of securing the harvest. Here are many good pictures with the much desired human

Flowers of the Hedgerow.

Noonday Heat.

RYSIDE MER-TIME

interest. Though so much farming is now mechanised, in some parts the age-old methods still prevail and these compel the camera-owner's interest, not only for their pictorial possibilities, but their value as records.

Then there are the country types—the farm hand with gnarled hands and leather-hued face, and always the healthy children as useful models.

Any kind of camera will do to take

Meadows.

Building the Rick.

on such a jaunt to the country that we have in mind. Even the cheapest instrument will give you well exposed negatives of the "normal subject" type of picture that abounds. Of course, a focussing model will increase your range of subjects and enable you to secure dead-sharp pictures of figure and flower studies, and if you have a fully-speeded shutter of the Compur type working in an $f/4.5$ lens there is nothing that you cannot attempt.

My own camera on all country walks is now a twin-lens reflex, and this seems capable of dealing with any kind of open landscape picture, figure studies, clouds, or "close-ups." A reliable exposure meter can be recommended for these subjects as the light is much more variable in character than at the seaside, and there is probably greater chance of under-exposure, especially when dealing with heavy foliage and with figures at close quarters. The effect of colour has

also to be taken into account in summer landscape work.

Though ortho films are quite good for this type of work, and in fact are preferred by some workers, my own choice is for a super-speed pan, and a two-times filter always on the lens, and subsequently processed to secure fine grain. Thus equipped, and with a Dufaycolor film to capture some of the glory of colour that Nature will sometimes offer you, a bag of good pictures, either for holiday records, for lantern slides or for exhibition purposes, can be assured.

The Farm Gate.

Readers' Hints, Tips and Gadgets

A FILTER-HOLDER FOR NOTHING.

MANY photographers have two cameras, one often a large model now almost superseded by a miniature. To make one filter do for both cameras, a special mount, sufficiently durable for the probably infrequent use of the large camera, can be made as follows:

One of the small cylindrical aluminium containers for spools such as that used by Agfa (Fig. I) can be obtained for nothing, and the lid will be found to be very nearly a fit for the large lens mount. The metal is very soft and cuts easily with either scissors or a sharp knife. The only tool required is a pair of thin-nosed pliers. The top of the lid is cut off, and cuts are then made along the dotted lines shown in Fig. II, leaving four "spurs" along the bottom edge—equally spaced. The serrations along the top edge are now bent slightly outwards or inwards, with the pliers, depending on what is necessary to make a good fit on the lens mount.

Any ordinary square glass filter can be fixed to the front by bending over the four "spurs" (Fig. III). If it is preferred, three of the spurs only need be used and the other cut away, enabling the glass to be changed or removed as required. A coat of black paint inside the holder, and it becomes a handy little makeshift device which saves the expense of a special filter for an obsolete camera. It also acts as a satisfactory lens hood, while the filter-glass, being held a short distance from the lens, does no harm—rather the reverse.

One point to note. The aluminium being very soft, the device must be carried in a small box and not pocketed loose, otherwise it may emerge in a very astonishing shape, and be quite unsuited for its purpose.

L. S. P.

ANGLES OF VIEW WITH THE TWIN-LENS REFLEX.

IT is, of course, generally realised that the twin-lens miniature reflex taking 6×6 cm. pictures contains within itself all the other miniature sizes and that the usual focal length of 7.5 cm. can be used for narrow-angle effects by going farther from the subject and enlarging a small portion of the negative.

It is, however, of definite value deliberately to compose the picture in its restricted area on the ground glass by using over the latter black paper masks of varying apertures and marked with the angles obtained with the unchanging camera focal length, thus insuring against distorted perspective.

Three masks slightly under 6×6 cm. square with apertures 40×40 mm., 34×34 mm., 24×36 mm. (Leica size), and giving angles of 42°, 35° and 34°

respectively, will be found very useful, and if a square piece of blue Cellophane similar to that on the recently published "A.P." view meter is carefully attached to the largest of the masks a very fair idea of the subject in monochrome will be obtained.

Unless the photographer has become so used to the square screen that he mentally trims the picture at the time of viewing to the horizontal or vertical shape that it will finally assume, he may find it easier to have rectangular rather than square masks. In that case, of course, the mask will have to be turned whenever it is desired to change from a horizontal to a vertical picture, or vice versa. Suggested sizes for these are 4.5×6 cm. (for use with the normal angle of the lens), 52×36 mm., 44×30 mm., and Leica size.

T. S. DOBLE.

LENS HOOD FOR CAMERA WITH FRONT-CELL FOCUSING.

THE sketch shows an alteration to the "spring-over" type of lens hood to make it suitable for fitting to cameras where the focussing distances are engraved on the mount. If the hood is fitted hard up in the ordinary way the figures are covered, and the mount easily slips round, so that one is very apt to get the wrong distance without knowing it.

With the hood as altered the mount is first set to the figure required and the hood is slipped over the mount to engage the pin. The small slots are arranged to catch on the pointer, so locking the focussing in the desired position. It is only the work of a second or so to alter the setting to any other distance.

A small flat file will cut the metal away quite easily. A slot is first cut for the pin, being made deep enough to allow the hood to slip on as far as it will go. The slots for the different positions are now marked out carefully from the mount and filed out to suit. A small strip of stout paper, stuck on the hood with "Seccotine," is marked in black indian ink with the distances corresponding to the slots. A little varnish over the paper and figures afterwards will make it waterproof and durable (mine has been in use two years with no sign of coming off).

The sketch shows the hood as altered for a "Kodak" camera, but doubtless the idea can be adapted to instruments of other makes.

C. G. H.

The Ideal Holiday Camera

Sterling British Value!

The delightful simplicity in operation, and the splendid results that are obtained combine to make the ENSIGN SELFIX-20 the Ideal Camera for the Holidays. Whenever your relations or friends ask you to recommend to them a camera giving perfect pictures with a minimum of skill, tell them of the ENSIGN SELFIX-20.

Here are some of the features:—

- Smallest Folding Camera taking full-size ($2\frac{1}{4} \times 3\frac{1}{4}$ in.) pictures on standard size 20 film.
- Also gives 16 "Two-on" pictures ($2\frac{1}{4} \times 1\frac{1}{8}$ in.) by means of a detachable mask placed in the back of the camera.
- Easily erected, speedy in action, simple to operate.
- Direct optical and reflex finders.
- Film registering device ensures absolute flatness of film.

ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1

ENSIGN SELFIX-20

Look for this sign in
your dealer's window.

Do you know what this is?

The illustration shows the special prism construction of the built-in photo-electric exposure meter of the Contax III. This exposure meter is constructed so as to embrace the same angle of view as that subtended by the normal 2-in. camera lens, and it therefore ensures an accuracy rarely equalled by any other exposure meter used independently. The cover also serves as a shield to cut out "top light", which might otherwise cause false readings.

Besides measuring the exact exposure for any subject under any lighting condition, both in daylight and artificial light, the Contax III eliminates guesswork from focussing, because the distance meter and view-finder, which are combined in one eyepiece, is coupled with the lens. This long base distance meter is constructed according to the Zeiss Ikon patent sliding wedge system and is so accurate that even the ultra-rapid Zeiss Sonnar f/1.5 can be used at full aperture with the certainty of needle-sharp focus.

The choice of 15 interchangeable Zeiss lenses enables the most diverse subjects to be taken, while the metal focal-plane shutter, speeded to 1/1,250th of a second, will tackle the fastest sports subjects.

All Contax cameras sold in Great Britain or Ireland at current listed prices carry the Zeiss Ikon written three-year guarantee. Ask your dealer for particulars.

CONTAX III

The story of the Contax and all Zeiss Ikon Miniature Cameras is told in "Contax Photography". Write for a copy.

ZEISS IKON LTD., 11, Mortimer House, Mortimer Street, London, W.1

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

Fishing and Fishermen

By HAROLD BURDEKIN.

WEATHER-BEATEN.
1/50th sec. at f/8, no filter. Dull light.

THE great charm of a holiday is that the photographer has plenty of time in which to work and to select his subject matter, for good selection and keen observation are half the battle in making good pictures.

A branch of photography which offers scope for pictorial work is depicting the various activities of the fishing industry.

In most fishing subjects both sea and sky will play a part, so that the use of a filter, even if not a very deep one, is almost imperative. The ordinary ortho-

chromatic emulsion without any filter is not at all suitable for rendering the blues and greens of sea and sky. I have found that the best results are obtained with a panchromatic film, and personally I like one in which its sensitivity is towards the red end of the spectrum. It is then not so sensitive to the blue and will give a good sky or sea rendering without the aid of too dark a filter, thereby allowing exposures to remain quite short. For all-round work a medium yellow filter will give all that is required.

A word of warning when you are

LANDING THE FISH.
1/50th at f/11, light filter. Bright sunlight.

PATTERN.
1/60th at f/11, medium filter. Bright evening sun.

photographing subjects by the sea. The light is very actinic, and it is a wise plan to consult an exposure meter to see that your negatives are not over-exposed. Miniature negatives which are over-exposed never produce good enlargements, and I have found that grain is increased.

When photographing fishermen, always try to catch them unawares and doing their work. Even good portrait studies can be obtained without them knowing that they are being photographed by using

MENDING HIS NETS.
1/50th at f/8, medium filter. Bright sun.

a long-focus lens. The little miniature camera can always be hidden away until the moment of exposure. In many cases you will not need to attract attention by using a focussing device, as the lens can be stopped down to f/11 and so will give a depth of focus to cover all you require.

Never snap your subject on the impulse unless it is absolutely necessary. Walk round the subject and study it from all angles and in different lights. For instance, in "Pattern" it took me fully fifteen minutes before I felt that the subject was satisfactorily composed. I endeavoured to get the lines of the two boats to make a pleasing pattern, and the fishing basket was used to pull the lines together. The lighting also threw some nice shadows, and made an acceptable picture of the whole.

OLD SALTS. 1/50th at f/8, no filter. Diffused sunlight.

Adapting Larger Cameras for 35-mm. Film

This article shows how any ordinary roll-film camera can be adapted for 36-exposure lengths of standard ciné film.

to prevent the mask from slipping up and down.

The view-finder, or in the case of a reflex the top focussing screen, must also be masked to give the same reduced angle of view. Black paper gummed on will suffice for this.

Fig. 1. Adapting a standard spool for 35-mm. film.

AT holiday time, when exposures follow one another in rapid succession, a 36-exposure film rescues one from the nuisance of too frequent reloading. There is no great difficulty in adapting a camera to take miniature film; the only two essential requirements are a mask for the back of the camera, and spools to take the narrower film.

For the spool, all that is necessary is to gum a strip of half-inch material around each end of a couple of empty bobbins. Passe-partout binding, or even a worn-out typewriter ribbon, can be used. They should be left at least a day to dry through.

The mask, Fig. 2, consists of a small piece of stiff card cut to slip just inside the picture-space at the back of the camera. In the centre of this card a hole 24×36 mm. is cut. On one side is stuck a pair of paper strips which will prevent the mask from falling through the camera aperture and at the same time will form a channel along which the 35-mm. film will slide. On the other two edges of it, two further strips may be required, according to the character of the individual camera.

Fig. 2. The mask, shown with and without the strips used for fitting to the camera.

Fig. 3. Putting the mask in place.

First, the film is wound on to a spare bobbin. After trimming the free end to fit the slot, the film can then be started on to the top bobbin in the ordinary way, as in Fig. 4, when the camera can be closed and is ready for work.

Loading and unloading must be done in the dark unless a paper backing is used as described below.

There are three ways to determine how much one should wind on for each exposure. The simplest is to make one complete revolution of the winding-knob each time. This method is certain and easy, but it produces a space, increasing with each exposure, between negatives, and so is a little wasteful of film. Another way is to make a dial, either on the knob itself or around it, as shown in Fig. 5. This is achieved by inserting a strip

Fig. 4. Loading the camera in the dark-room.

of film, winding 8 perforations (one frame) at a time, and marking a spot or number on the dial for each. In using either of these two methods it is essential to seal up the red window of the camera, because the film has no protective paper.

Another scheme is to use a length of the backing-paper which has been saved from ordinary spools, and cut it carefully to a width of 35 mm. This is wound on to the top spool with a strip of film inside it, and a number is marked on the backing-paper, in the appropriate place for the red window, for each frame.

Once one backing-paper is marked off, others can be made from it, and as many spools of film as desired can be made up. Each such home-made spool will hold less than 36 exposures, but this scheme offers the great advantage of allowing loading and unloading to be done in daylight.

Modern Miniature Cameras

THE V/6 BRILLIANT.

TO the very popular range of Voigtlander Brilliant cameras there has just been added a de luxe model, known as the V/6, which will be on sale by the time this review appears.

Like the other members of the series, the new camera is built on the lines of a twin-lens reflex, though it must be made quite clear that it is not a reflex in the accepted sense of the word, since in the finder everything is always in focus. The Brilliant consists essentially of a fixed-extension camera fitted with a high-grade lens and shutter and equipped with a brilliant view-finder. The reflex-like form of the camera has arisen through making the view-finder really large—it shows the picture about two-thirds actual size—and providing it with a hood to screen it from extraneous light and so avoid the reflections to which the upper lens of a finder of this type is particularly prone.

The body of the V/6 is of unbreakable moulded material, with polished edges and inset panels having a grained finish to suggest leather. The lens fitted is a 7.5-cm. Voigtar of full aperture $f/3.5$, mounted in a Compur-Rapid shutter speeded to $1/5000$ th sec. Focusing is done by scale in the usual manner, the front cell of the lens rotating to provide the necessary adjustment. The scale marked on the edge of the cell runs to 3 ft., and the figures are so placed that they are visible from above, thus enabling the scale to be set to the desired distance with the camera in the "ready" position.

Direct and Brilliant Finders.

The self-erecting hood over the view-finder is of metal, and by pressing down the front panel it transforms itself into an effective frame finder for eye-level work. The illustration shows it adjusted for this purpose. The finder itself gives a surprisingly brilliant image, and it was noted that the field of view it indicates does not vary, as with some brilliant finders, with the position from which it is viewed. It is interesting to notice that the scene appears much more brilliant in the finder than when viewed direct.

In the side of the camera there is a door, which opens to reveal a compartment containing the wire release. Moulded rings on the inside of the door will hold a yellow filter and a portrait attachment, or one of these and the special Brilliant exposure meter. To lift off the desired accessory and slip it over the lens is the work of an instant only, and the filter or portrait lens used need never be handled, except by its rim.

Automatic Film Advance.

For loading, the back and bottom of the camera hinge open together. In the V/6 automatic film transport is provided. After putting in the new film, it is wound on till the first number shows through the red window, and the counter is then set to "1" by touching a small button. This locks the winding mechanism. After the first exposure a release button is moved, and the film can then be wound on by one frame, when the mechanism locks again, and the counter indicates "2." The film can thus be wound on in a second or so without having to look at the camera, which is a great convenience when exposures are required in rapid succession.

The V/6 Brilliant is convenient to carry, its dimensions being $4\frac{1}{2} \times 3\frac{1}{2} \times 3\frac{1}{2}$ in. over all projections, and its weight only 22 oz. The price, including wire-release and neck-strap, is £9, and it can be obtained from any dealer. Further details of this or of the other cameras of the Brilliant series can be obtained from Messrs. Schering, Ltd., 185-192, High Holborn, W.C.1.

Miniature Camera Gossip

By LANCELOT VINING.

I LEFT London in a blaze of sunshine and wended my way to the sea; next day the weather had turned sour and as early as 11 a.m., when the pool at St. Leonards ought to have been full to overflowing, it was windy, cold and light rain was falling.

Two people sharing the same shelter were lauding the cleverness of the Voronoff Twins in their shadow dance at the White Rock Pavilion. Rather than return to London empty-handed, I decided to remain over and have a look at these two young dancers that evening.

Their "Dancing with my Shadow" dance was novel and perfectly executed. Even the fingers of the left hands of the dancers are placed exactly alike.

THE VORONOFF TWINS. $1/50$ th at $f/2$, on Agfa F.

Very American.

I want to thank the reader who sent me these verses, they are by James L. Duff, and were published in *The New Yorker* for 19th June, 1937. If not quite truthful they are certainly amusing.

"As a Matter of Fact"

When a camera was a Kodak
With no special shutter speed,
When a universal focus
Was all that one would need,
When "Life" was being published
For people who could read,
We used to snap Aunt Emma
In her gown of lace and net.
We used to snap Aunt Emma
Not in some de luxe dilemma;
No, we merely took Aunt Emma—
And we'd wait till she got set.

Then no one with a Leica
Was behind the bathroom door;

Then no one with a Contax
Was snooping for your snore;
Folk took their pictures standing,
And never from the floor.
In those snaps we took of Uncle,
We tried to hide the wen;
The finest snaps of uncle
Did not show that old carbuncle
And the chances are that uncle
Would sit for us again.

No Retina was peeking
Through the trellis and the trees:
No Graflex by the window
Caught Sis in her chemise;
No Minica at the picnic
Saw Dad's colossal sneeze.
When we took some shots of mother
In the garden with a rose,
She was right side up, was mother,
You could tell it was no other
For we made the shots of mother
And not of mother's hose.

The Miniature for Interiors.

I was able to once again demonstrate the utility of the miniature camera when a friend invited me to photograph his new house and garden, interiors included. As an extra, I threw in some colour shots of the garden. As usual I managed to dispense with a tripod, for the extreme depth of focus characteristic of the miniature allowed me to use $f/4$ for the indoor shots without getting the foreground furniture fuzzy.

Camera in hand; $1/5$ th at $f/4$, on Agfa F. Mixed daylight and electric light.

TEN GUINEAS AND UNDER

A Section for the User of the inexpensive Miniature.

The Cyclist's Companion

"Butter-fingers!"

THE confirmed cyclist always likes to reduce the weight and bulk of his impedimenta to the smallest possible limits. I was first attracted to the inexpensive type of miniature camera by their extreme portability; they are light and, carried in the pocket, they neither get in the way nor require unpacking when it is desired to take a photograph.

My Ensign Double-8 weighs only a fraction over nine ounces, and sixteen photographs at one loading means that the supply of spare films need only be

"Now Try Again."

quite small; for a day trip the one in the camera is usually enough.

Like a good many other beginners with a miniature my first efforts suffered quite badly from camera-shake; practice, however, has enabled me to get over this initial trouble. Now that I am thoroughly confident of my ability to obtain

Treasure Trove.

satisfactory results, my camera accompanies me on every trip. And to this I owe many such sets of photographs as the three reproduced herewith, which recall very pleasing memories of a hot-weather dip in a stream by the side of which we paused for lunch during a short tour in the Cotswolds. H. W.

Eighteen Instead of Sixteen

NO doubt many miniature enthusiasts who use 3×4 cm. cameras will be interested to know of a simple method of obtaining 18 negatives per roll instead of the more usual 16—a film saving of $12\frac{1}{2}$ per cent.

It occurred to me when developing a roll recently that there was ample waste film at the ends to allow of two additional negatives, one at each end, and after a little experiment I found it quite easy to obtain the desired result.

Using a Kolibri camera and Isopan F film, the film is wound on slowly until the "I" of the word "Isopan" just shows at the bottom of the first window. This leaves the edge of the first negative just clear of the sticking-down tape attaching the film to the backing-paper. The second exposure is made when the

figure 1 is turned right to the top of the first red window, beyond the position it would normally occupy. As the film is exposed, the numbers are gradually brought back to the normal position in the windows, and after the 8 has been exposed in the top window the winder is given seven-eighths of a full turn and a further exposure made.

It will be found that there is still enough film left at the end to enable the film to be stuck to the backing-paper in daylight and developed in a tank in the ordinary way.

Users of "16-on" cameras, whether of 3×4 cm. or 4.5×6 cm. size, who wish to effect this economy should roll an exposed film, with backing-paper, through their cameras to find for themselves the settings necessary with the film they favour. D. P. JOHNSON.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

"SEASE."

The word "Sease" is frequently used in conjunction with fine-grain developers. I cannot find this word either in a large dictionary I have or in the "Dictionary of Photography," so I should be glad if you will tell me what it means.

T. McN. (Aldershot.)

Dr. Sease, the Chief of Research for the Dupont Film Corporation of America, was the originator of the "Sease III" and other developers containing paraphenylene-diamine and glycine, and they consequently bear his name.

MARKS IN PHYSICAL DEVELOPMENT.

I enclose a negative developed physically in a tank, using the method given by Wolfman in his book "The Fine-Grain Negative." Can you explain the markings on the negative?

J. B. W. (Carmarthenshire.)

Inspection of your negative suggests that parts of it were wetted, probably with the forebath, a few seconds before the other parts. This you can avoid if you put the solution into the empty tank, and then also the reel into the solution, turning it as you put it in, and lifting it up once or twice in the first few seconds after the immersion.

DEVELOPMENT TIMES.

Can you suggest a suitable time for developing the new Agfa Isopan F film in D76? So many different times have been mentioned that I am rather at a loss. I recently developed a new-type F film in the Agfa 14 developer for 13 minutes at 65 degrees, and I personally thought the negatives too hard. Does this time seem excessive to you? R. C. (Bath.)

It is difficult for us to suggest any very definite time for the development of any film, because it depends so much on the kind of negative you wish to produce. With the new Agfa Isopan film and D76 developer we should suggest from 5 to 7 minutes at 65 degrees Fahr.

We are not sufficiently familiar with the Agfa 14 developer to make any comments on your development time, but, as the negatives were developed more fully than you like, the time was obviously excessive.

FILM FOR FOREIGN CAMERA.

I have just come into possession of a camera which uses 35-mm. film and makes up to 50 exposures on a single length. Where can I get recharges of film for it? The camera is called the "Amourette," but nobody seems to stock films to suit it.

D. H. L. (Manston.)

We are not familiar with the camera that you have, which is not, we think, on the British market, and we therefore cannot advise you as to where you can obtain film in chargers to fit the camera. As the name suggests that it might be of French origin, you might write to Maison Tiranty, 91, rue La Fayette, Paris, XI^e, who are well-known dealers, especially in miniature cameras. If you are already in possession of sufficient chargers you can obtain 35-mm. film with which to reload them through any photographic dealer, in lengths from 15 ft. upwards.

A SIX-EXPOSURE FILM.

During my holiday it is my intention to use only Dufaycolor film in my "Brilliant" camera. This camera, making 12 exposures on a normal 8-exposure film, has an automatic counter. How do I use it for a Dufaycolor film which gives 6 $3\frac{1}{2} \times 2\frac{1}{4}$ exposures, and how many of my square pictures shall I get on each spool? C. N. (Purley.)

In the case of the "Brilliant" camera the counter is operated by the movement of the film itself, and therefore will work in a normal manner. Each film will give you 9 exposures in place of the 12 to which you are accustomed, but in other respects the camera is handled as usual. Load the camera, wind till "1" shows in the window, and set the counter. Wind off the finished film when 9 exposures have been made, instead of waiting till you have twelve.

LESS THAN THIRTY-SIX.

Can one avoid having to use all 36 frames in a Leica before development? Or can one buy shorter lengths of film? J. H. W. (Aberdeen.)

The simplest way of obtaining less than 36 exposures in a Leica is to use the Leitz chargers for which the camera was designed, and to load them yourself with film bought in lengths of 15 ft. or upwards. From such a length you can cut off enough to give you whatever number of exposures you desire. Filled chargers or cut lengths are only sold in strips giving the full 36 exposures.

August 4th, 1937

SNAPSHOTS in SUN or RAIN

By
PAUL CONNELLY.

EVERYBODY knows that sunshine is the best light for snapshotting nearly everything. It gives that brightness of high-light and sharp shadow which the professional attempts to emulate by means of his studio spotlight. Besides that, direct sunlight is the brightest light of all, so that the shortest exposures can be given when the sun is shining right on to the subject. There is no real photographic value, however, in shortness of exposure as such; the possibility of a short exposure simply enables us to photograph subjects which move or are liable to change in other ways such as the expressions of faces.

Screwed-up Faces.

But it must be remembered that in photographing faces direct sunlight may have grave disadvantages, for two reasons; one is that people screw up their eyes, and otherwise distort their features when they face the sun; the other reason is that the sun often throws the eyes

The enlarged version shows how unkind direct sunlight can be to faces.

A drop of rain will not hurt a camera, but it can easily be protected against a real drenching.

into deep shadow, making them look like holes rather than like eyes. But with a little watchful care it is easy to make use of the sun to produce a "spotlight effect" without allowing it to shine right into the "sitter's" eyes. It is done by turning the sitter's face away from direct sun, but not towards tall trees, rocks, or houses, which do not give any

light, but only prevent it from shining on to the subject.

Correct Lighting.

When the sun is shining on to a subject, the eye can usually see all the detail in the shadows. But the camera may not record all of those details, because the light on them may not be strong enough, by comparison with the sunlit parts, to record them on the film. It takes some little practice and observation to recognise the difference between conditions which are right and wrong in this particular respect. That is why it is best

For most subjects the lighting is good when the photographer's shadow falls thus.

reduce the strength of the light. With many cameras it is possible to compensate for this weakening of the light without increasing the time of exposure by using the larger stop-openings.

Keeping It Dry.

Naturally one would protect the camera from actual wetting, although a little moisture wiped off soon afterwards will do it no harm. If a tiny drop or two of rain does manage, in spite of care, to get on the lens itself it is better not to wipe them off if one wants to make more photographs immediately, but to leave them alone until afterwards. This is because the resulting smears will do much more to spoil the picture than a couple of tiny but isolated beads.

to stick at first to a condition which is almost sure to be right, and that is when the sun is shining at an angle of about forty-five degrees towards the subject. So if the photographer takes up a position in which the sun throws his shadow forward, as in the illustration, he can be pretty sure that his subject is most favourably illuminated.

Rainy Day Photography.

Although, as we have seen, sunlight has drawbacks as well as advantages, there is a natural tendency to leave the camera indoors when rain threatens to interfere with holiday activities. Next time it rains, take your camera with you, for rain gives us what nothing else can. Black rocks, or the dull empty surface of a road, become bright, and alive with interesting reflections.

During, or immediately after, a light shower there is often no need for any special technical adjustment, but it is well to remember that rain means clouds, and clouds of the rainy sort reduce the strength of the light. With a snapshot camera, therefore, it may be advisable to avoid making exposures during anything but the slightest rain, especially if there is any other factor, such as tall trees or buildings, tending to

Reflections, and shiny roads, can make a wet day better than a sunny one for some subjects.

The SMALL BOY— Photographically Considered

By PERCY G. R. WRIGHT.

THE small boy can be either a great help or a great nuisance to the amateur photographer.

Somehow or other, the small boy always comes in big doses. Single specimens of the small boy can be dealt with. It is when he comes in battalions that he is so infernally troublesome.

The small boy has so much time on his hands; he is always ready to risk maternal punishment or scholastic detention in order that he may study the habits and customs of the pictorial photographer. There must be some sort of fascination about the amateur photographer that keeps him rooted to the spot—no, not rooted, he won't take root, that's the worst of it! He persists in hovering. His particular preference is somewhere in the near foreground, and just where he will do the least good.

He has an instinct for the angles of incidence, and stays there. That is, at least, when he has a backing. It requires nerve to face an irate photographer, and nerve to the small boy means numbers. If there is a crowd of him he will dare anyone.

Time no Object.

Nobody that I ever knew successfully out-waited the small boy. I've tried it times out of number and it's no good. The only possible remedy is to pack up and depart, with language suitable to the occasion or one's temperament.

Nevertheless, I must admit that the small boy may be dealt with if he can only be caught alone. He assumes a sheepish docility apart from his fellows, and if he can only be led off to some lonely, unfrequented position, from which he cannot summon aid, then he is a safe and, one might almost add, a profitable investment for an occasional exposure.

At times I have hunted the very small boy with an almost ogre-like determination, to catch him alone, unprotected and out of call. He has in this helpless position provided me with quite a number of opportunities for depicting his over-awed and usually unhappy features. In fact, so doleful is the monotony of his features that I have had to make the most pitiful of grimaces in order to provoke him—apelike—to imitate my smiles.

On the Continent it is the only way when dealing with small boys, who possess no more knowledge of my language than I have of theirs.

Unless the small boy is mercilessly hunted down and isolated there is no reliable way of dealing with him. Now and again one sees photographs of groups of small boys, apparently unconscious, and really quite naturally posed, but how often is this the result of fortuitous chance only the photographer knows.

The small boy appears from nowhere without warning just as you are about to take your masterpiece. If you photograph him in the hope that he will then disappear it will merely conjure up another small boy or two.

To photograph successfully small boys in groups with a reflex camera is out of the question. It is a case of a miniature camera or nothing. Most of my own exposures have been with a small collapsible pocket camera, or a flat roll-film camera that can be opened out quickly.

Unconscious groups of small boys require stalking—a reprehensible habit that I condemn utterly when "grown-ups" are the object of one's attention—and it is necessary to be

wily to the extreme. To this end, I have had the infinity catch of my camera altered from the usual point to 15 ft. so that I can open the camera behind my back, without having even to glance at the focussing scale. As soon as I hear the click of my modified "infinity" catch, I know that the focus is right. Then having adopted a reflective and detached air, I study contemplatively the most uninteresting and impossible subjects in the vicinity, and gradually sidle up to the correct striking distance. An occasional glance out of the corners of my eyes gives me a rough idea of the best arrangement, and then, without a moment's hesitation, the camera is brought into action, the exposure made, and in nine cases out of ten the group can be passed boldly and deserted.

Even then it is often a matter of luck, the grouping is good, but more often some change has happened and it has become hopeless. If the boys are so interested in their game, well and good, one can then remain and get a few more exposures, but usually you are spotted and any further photographs are out of the question.

The Element of Surprise.

To capture the small boy of peculiar or pictorial interest when he is seen approaching on a lonely road, the same unconscious or abstracted air is necessary until he is within the requisite fifteen feet, when the camera can be boldly brought out and the victim taken, almost under his very nose. The procedure is so barefaced and unexpected that one only need stop for a single second to get a successful result. But you never catch the same boy again in the same way. He looks on you with suspicion for ever after.

A good lens is absolutely necessary for the snapshot work of this description. The exposures must be very rapid ones, and as a consequence a large aperture has to be employed. Mine usually works at f/6 or thereabouts and requires an exposure of anything from 1/40th to 1/150th of a second, according to the light, the time of day, or the season of the year. Films are to be preferred to plates, because they are so much lighter to carry about.

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXCVII.

Mr.
J. TURNER.

From information communicated to our Special Representative.

"ALTHOUGH I have possessed a camera for quite a while, it is only some three or four years since I took up pictorial photography as a hobby. During the winter of 1933 I attended a lantern lecture entitled 'The Romance of Photography,' the lecturer being Mr. Arthur Marshall, of Bradford. I was so impressed with the quality of his work that I at once decided to take up the hobby in earnest.

"A short talk with Mr. Marshall resulted in my becoming a member of a postal photographic club, and as there is no photographic society in my home town of Pickering, the generous help and friendly criticisms which I have received from the Postal Club members have been invaluable.

"I do not specialise in any particular subject, but being a dog lover, I am ever on the look-out for a picture amongst my canine friends. For this class of work I have been using a quarter-plate Soho reflex fitted with a 6-in. Dallmeyer Serrac lens, this being interchangeable with a Dallan Telephoto of 12-in. focal length. I rarely use anything except the latter for head studies, and invariably work at its full aperture of $f/5.6$, in conjunction with as quick a shutter speed as circumstances will permit. Very slight movement will result in failure, so a good firm tripod becomes a necessity if this trouble is to be avoided.

"My aim is to secure a background as unobtrusive as possible, placing

camera and tripod in position before introducing the dog. The imitation of a feline call is usually effective in securing that alertness so necessary in this type of work.

"Bird life is a most interesting phase of photography, and it is only the lack of time at my disposal which prevents me from keenly following up this subject. For this work I use the same camera together with a 20-ft. release and a Luc silent shutter.

"I do a fair amount of cycle touring, and on these expeditions my constant companion is a 6×6 Rolleiflex, which will tackle most subjects one is likely to encounter. The picture 'Old Whitby' was taken with this camera during a cycling week-end, the exposure being $1/25$ th of a second at $f/5.6$ on Panatomic film. Ilford Soft Gradation Panchromatic plates are used for the Soho reflex, and developed by time and temperature in a Dallan tank, using Azol for $2/3$ rd of the time stated in the table. By this method I secure a soft well-graded type of negative suitable for use with a condenser enlarger.

"For the Rolleiflex I rely on Panatomic film on account of its fine-grain properties, and at all times use a lens hood. In this case development is carried out by means of a Perplex tank, using Johnson's fine grain developer at 65 degrees Fahr. The fixing solutions and washing water are brought to the same temperature as this is necessary if the fine grain of the film is to be retained. Enlargements are made on Kodak Royal or Gevaluxe Velours according to the type of subject, chiffon or the Misonne screen being used for any diffusion required.

"In conclusion I may add that an electric cell meter is used for all my exposures."

(A further example of Mr. Turner's work is reproduced on one of the centre Art pages.)

A SERIOUS BUSINESS.

J. Turner.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"SAND AND SUNSHINE," by M. Rodrigue.

IT would be easy, no doubt, to find points for which admiration could be expressed in connection with this seaside study. For one thing, the figure is spontaneously recorded and extremely well caught, and, for another, it has been secured without the inclusion of any of the multitudinous sources of irritation that usually infest settings of this nature; but, all the same, I do feel that it scarcely gets away with the intention indicated by the title and the idea of sand and sunshine is not as well brought forward as it might be.

That sand and sunshine are present is undeniable, but it seems to me—unless the title is more or less in the nature of an after-thought—that the point of the theme has been lost because the sunshine is too all-pervading and too widespread to rank as an effect, and, because it has no point, we do not gather that the essential quality of sand—or its sandiness—is fully expressed.

Whether the sunshine would tell to better effect or not if the area under its influence were more restricted is rather problematical. An increase in the proportion of shadow tone would, no doubt, be beneficial, especially if it could be introduced in the upper portion of the picture, for, besides tending to even up the bittiness of tone that this section shows, it would also have the effect of throwing up the lights on the figure. That would make it more distinctive, but the root of the trouble is, I think, that there is not a sufficient difference between the tones of figure and setting.

If the figure were very much darker, it is probable that the sunshine on the sand would appear correspondingly brighter, i.e., assuming it were a bit more restricted in the manner already indicated; but, under the conditions existing at the time of exposure, and from the same viewpoint, it would have been quite impossible to get such a rendering, and any attempt to bring it about would necessarily in-

volve a conflict with realism. Suppose, for example, that the contrasts were forced up by prolonging the time of development, it is true that the figure would be rendered in a darker tone, but, while the lights might retain their present modulations, all the shadows would acquire an increased density, the impression would be more bitty still, and the rendering,

rendering could be expected and that no subsequent adjustment is practicable.

It will also be appreciated that the bittiness of the setting is almost wholly attributable to the fact that the subject is seen against the light.

The many hollows in the surface are shown as shadows, and it is their detached character that makes the background so assertive. For the same reason, the main mass of the figure is made up of shadow tone, and the only lights it exhibits are those of its outline, which, unfortunately, all seem to come up against a light in the setting.

The inference is, of course, that the lighting was not suitable for the subject as it was and that the choice of viewpoint was at fault. It seems to me that far more justice would be done to the subject if it had been taken from a standpoint some few yards to the left and a bit farther forward, the line of sight being turned to the right, so that a semi-frontal view of the figure was obtained. The change in the point of view would involve a change in the direction of the lighting and the figure would be shown half in light and half in shadow. The textural differences in the surface of the setting would not be so marked and its assertiveness would be considerably lessened, so that, provided no incongruous element were introduced, the alteration in stance would be likely to offer a much improved representation in several respects.

Nevertheless, it has to be remembered that the stalking of children is no easy job, and, even if they are so absorbed as this one seems to be, too much scouting round for a viewpoint may mean the loss of the subject entirely. But, if we are out to do the best that can be done, this is a risk that has to be taken, and, if some things are missed, sooner or later persistence will be rewarded with a real success.

"MENTOR."

as a whole, would seem harsh and out of harmony. If the figure alone were darkened, as it might be by the exercise of local control, it would stand out more effectively, but it would be out of tone with the setting, and anyone who knew what it should be, would be led, by the falsity of tone and the reduction in the reflected light, to suspect an interference with the natural rendering.

We are, therefore, forced to the conclusion that, in the circumstances at the time of exposure, no better

offer a much improved representation in several respects.

Nevertheless, it has to be remembered that the stalking of children is no easy job, and, even if they are so absorbed as this one seems to be, too much scouting round for a viewpoint may mean the loss of the subject entirely. But, if we are out to do the best that can be done, this is a risk that has to be taken, and, if some things are missed, sooner or later persistence will be rewarded with a real success.

"MENTOR."

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

STRETCHES of open countryside, chequered with the pattern of hedges and trees, can, at times, be made into most attractive pictures. No. 1 of the prints reproduced on the opposite page—"Sleepy Somerset," by J. H. Brent, conveys something of an idea of what is possible, and, for a commencement, it is by no means a bad thing.

Landscape in the Open.

As far as the distance is concerned, it gives a very good rendering and the shadow in the immediate foreground is useful, but the blankness of the sky does not accord very well with the fulness of tone in the landscape below, and the subject needs something not only to pull the arrangement together but to serve the function of providing a centre of interest.

On the left-hand side of the print there is a portion of a tree, something like fifty yards away, which, if it were brought more into the picture so that it came about one-third of the way across, might do very well. A strong dark such as this, placed just in that position, would serve as a keynote which would have the effect of making a focus point on which all the lines of the landscape would converge. It would have the effect of unifying the interest, which, at present, is more or less dispersed over the whole scene, but, judging from the intruding branches nearer to hand on the same side, some difficulty might be encountered in finding a point of view that, while allowing the more distant tree to be included, enabled the intrusion in question to be avoided.

However, that is a point that could only be determined on the spot. The rendering of the sky, on the other hand, is a thing that could undoubtedly be bettered. With so open a subject, a light filter, even with the ordinary run of orthochromatic emulsions, would be sufficient to ensure the needful modicum of tone, and with panchromatic material, it would be easier still.

Light Filters and Skies.

That abrupt transition from the comparative dark of the landscape to the light of the sky is too sudden to be harmonious, and, when it can be corrected by the simple expedient of putting a light filter over the lens and

making the necessary allowance in the exposure time, it really should be done.

The subject could stand quite a strong sky, but even were it no more forceful than that of "Morning Exercise" (3), by H. Haydon, it would present an improvement over the existing interpretation. The tones of the latter example are restrained throughout and the sky is perfectly suitable, but in the arrangement there is more than a suspicion of "two ways out," a feature which creates a division of interest.

The eye is led to the distance by two routes—the one to the left of the central trees and the other to their right. If the two leading lines eventually arrived at the same point in the distance, the arrangement might be acceptable, but, as the print stands, the tendency is for them to diverge and nothing can prevent it. If the roadway could have been omitted and the space between the trees and the boundary hedge on the left were filled up, the feeling would be entirely countered, but that, of course, is an impossibility with the subject as it is.

Leading Lines.

In the case of the print below—"Duisburg" (5), by M. A. Vernon—the more important leading lines are those of the two river banks. At their commencement, they run in similar directions and would, if continued, create a similar sense of division, for the one would run out of the picture on the left and the other, as at present, would merge into the horizon line.

But the one on the left forms a good sweeping curve and turning towards the right meets the other in the distance. The two directions are united, and, consequently, no suggestion of divided interest arises. The arrangement of the composition represents an advance over the print formerly discussed, but, here again, the sky is rather deficient in tone.

No. 6, "Before the Storm," by B. M. Crayston, is better in this respect, but the subject is very open, and, with any reasonable approach to a correct exposure, it should not be at all a difficult matter to get such well-marked clouds with or without a light filter. The leading lines of the picture, however, tend to run out on

the right-hand side, though, as it happens, the tendency is, for all practical purposes, stopped by the strong note of the bird towards the centre and by the closing-up of the clouds on that side.

Compositional Expedients.

The device, in this instance, would probably be quite fortuitous and not consciously incorporated because of its effectiveness, but it is an expedient that is often adopted by painters and draughtsmen when dealing with themes of similar tendencies, although, as a rule, the stop is made more decisive and a leading-in line is also included.

A further good characteristic of the rendering is its representation of the tones of the clouds. They are full and well modulated but not exaggerated. Too many beginners, when trying a subject of this kind, make the mistake of producing a rendering with excessive and violent contrasts which neither accord with nature nor convey a true impression of the effect.

An example is to be seen in No. 2, "Close of Day," by C. L. Williams, where the tones are not only too heavy by a long way, but are also more than inclined to excess of contrast. The darks are much too intense and appear choked up, while the key as a whole is more sombre than anything ever seen under normal, or even abnormal, conditions.

Misguided Technique.

Such a rendering is simply the product of misapplied and misguided technique. The negative, in the first instance, was, apparently, under-exposed; it was over-developed, and then printed—or rather, overprinted—on a grade of paper that was far too vigorous for it. A lighter print on a softer paper would, no doubt, afford a better rendering, but, of course, no expedient can provide such modulation as may be lacking on account of under-exposure.

No. 4, "The 'Mary Barrow'," by Roger G. Lane, shows a tendency in the opposite direction, for its contrasts are devoid of the vigour the subject would display. A paper of greater contrast is indicated, but, as far as can be seen, the exposure is perfectly adequate.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

PARALLAX AND THE VIEW-FINDER.

THE very first thing I ought to do now I have sat down to write this note is to get up again and see what a dictionary says about the word "parallax"; but if you don't mind (and even if you do) I will chance my own idea that parallax is an *apparent* change of position resulting from an *actual* change in viewpoint. This has several photographic applications, but before dealing with the one relating to view-finders we can get an idea of other photographic points as well if you will carry out an experiment under my direction.

You had better do this when you are alone, or your actions and grimaces may create a wrong impression and even give rise to serious anxiety. I will suppose that you are sitting where you can see through a window a house on the other side of the road.

1. Hold your first finger upright, two or three inches in front of your nose, and so that one side (not back or front) is towards you. Look at it with both eyes. (If you could see yourself now, you would understand why I advised solitude.) You see the finger solid and round, and it obscures a good slice of the vaguely seen house.

The solidity given by the combination of the two-eyed view is the basis of stereoscopic work.

2. Without moving your finger look at the house. The finger is transparent; you can see the house through it;

and there is a second finger vaguely seen to one side of the real one.

With a long-focus lens, focussed on a distant object, a partial obstruction, like wire netting, close to the lens may be diffused so much as to be "transparent."

The two images of the finger are not identical. One shows more of the nail side than the other. Stereoscopic views are not identical.

3. Still looking at the house, shut the right eye; the finger jumps to the right. If you shut the left eye instead the finger jumps to the left.

This is an example of parallax. The finger has not actually changed its position; the different angle of view of the two eyes causes the apparent shift.

4. If you could get someone to stand near the house, and hold up a finger, you would hardly be able to detect any shift at all when you looked at it with alternate eyes. The nearer the object is to the eyes the greater the apparent shift.

Now we can get an idea of the cause of the trouble when we sometimes find that the subject we had placed so carefully in the field of the view-finder, is placed in a very different way in the field of the negative. If we studied our results we should find that the trouble arises with "close-ups" and not with more distant views.

The two illustrations—not quite the same sort of thing—are meant to give an idea of the difference between finder view and lens view, for near and for distant objects.

With a single lens camera we can see the true image on the focussing screen; with a twin-lens camera the two views are not identical, although a sufficiently practical correction can sometimes be made. The worst case is the camera with a separate small view-finder. If the

view-finder includes about the same amount of view as the lens it will not be so hopeless, but there is bound to be error which increases rapidly for nearer and nearer objects.

Here is a hint. Get the finder image right, and then before making the exposure shift the camera so that the taking lens is in the previous position of the finder lens.

W. L. F. W.

HOW MUCH DO YOU KNOW?

By
T. F. LANGLANDS.

IT is only right—in view of the maddening questionnaires set to worry us in the daily and weekly press—that amateur photographers should have the opportunity of answering a few teasers in their own province.

After guessing correctly the date of the Battle of Hastings, and the identities of the monarchs who burnt cakes, or studied the habits of spiders, these posers should prove quite simple. Well, just try them, and decide for yourself.

A. BACKING IS:—

- (1) A kind of polish for the bellows.
- (2) An adhesive mount for large photographs.
- (3) A special plate-holder.
- (4) A coating on plates and films.
- (5) A material used in retouching.

B. A PHOTOGRAPHIC PROCESS, NOW OBSOLETE, MADE USE OF:—

- (1) Soda water.
- (2) Tea, with milk and sugar.
- (3) Nitric acid.
- (4) Lemonade.
- (5) Beer.
- (6) Salts of lemon.
- (7) Citrate of magnesia.

C. ALL SUCCESSFUL PHOTOGRAPHERS UNDERSTAND THE USE OF:—

- (1) An exposure meter.
- (2) An iris diaphragm.
- (3) An $f/2$ lens.
- (4) A range-finder.
- (5) A cable release.

D. THE HYPERFOCAL DISTANCE IS:—

- (1) The distance at which to take close-up portraits.
- (2) Ten feet.
- (3) The infinity mark on the camera.
- (4) The lens position for distant views.

- (5) The lens position for best all-round sharpness of near and distant views.
- (6) The scale on a range-finder.

E. PANCHROMATIC FILMS ARE NOTED FOR THEIR SENSITIVITY TO:—

- (1) Red.
- (2) Ultra-violet.
- (3) X-rays.
- (4) Infra-red.
- (5) Blue.
- (6) Green.

F. AMIDOL IS USED MAINLY FOR:—

- (1) Desensitising plates and films.
- (2) Fine-grain developing.
- (3) Developing bromide papers.
- (4) Reducing over-exposed negatives.
- (5) Toning platinum prints.

G. THE ONCE POPULAR ABBREVIATED TITLE FOR A PRINTING PAPER IS:—

- (1) DIN.
- (2) C.D.V.
- (3) S.O.F.
- (4) H. & D.
- (5) P.O.P.
- (6) A.R.P.S.

H. PHOTOFLOOD LAMPS CONTAIN:—

- (1) Magnesium foil.
- (2) Tinfoil.
- (3) A tungsten filament.
- (4) High intensity carbon electrodes.
- (5) Mercury vapour.

I. DUFAYCOLOR FILM IS BASED ON:—

- (1) Three-colour multiple-coated film.
- (2) A regular printed additive colour screen.

- (3) An irregular agglomeration of dyed screen particles.
- (4) Superimposed three-colour carbon emulsions.
- (5) A lenticular film base.

J. PAN. FILMS ARE SPOILT BY:—

- (1) Red dark-room illumination.
- (2) People with florid complexions.
- (3) Heavy, cloudy skies.
- (4) High-speed lenses.
- (5) Developing in hot climates.

K. DISTORTION MAY BE CAUSED BY:—

- (1) Too large a lens aperture.
- (2) A focal-plane shutter.
- (3) Hypo contamination.
- (4) An incorrect view-finder.
- (5) Using the wrong filter.

L. PLACE THE FOLLOWING PHOTOGRAPHIC PROCESSES IN CHRONOLOGICAL ORDER:—

- (1) Gelatino-bromide.
- (2) Daguerreotype.
- (3) Wet-Collodion.
- (4) Calotype.

Of course, you guessed those correctly, without the least indecision; but to make doubly sure, turn to page 148.

MAKING BETTER SNAPSHOTS-9

By DAVID CHARLES.

This article is the ninth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. This sort of frame is often easy to find, but seldom suits the subject.

Fig. 3. A change from the "open river" view. Found only when looked for.

Fig. 4. The dainty filigree pattern over the sky was carefully arranged.

IF I were looking for a sub-title for this particular "talk," I should call it "Framing the View." I feel sure there is no necessity this time for displaying an undecorated example, because I am equally certain that my readers will have all too often experienced and felt the necessity for some way of concentrating attention on the essence of their scene. It does so very often happen that the view one wants to photograph is crowned by an absolutely cloudless sky, or that at one side or other there is some discordant matter, such as an advertisement sign, which one would like to hide.

An Artificial Frame.

The fact is that so soon as one gets used to the idea of a "frame" in the way described and illustrated here, and one becomes familiar with the method of seeking it, all sorts of opportunities for using the idea seem to present themselves automatically. Frame No. 1 is, it must be admitted, rather in the nature of a "stunt." It was obtained simply by photographing Trafalgar Square through an aperture in the balustrade on the north side of the square. The frame does, in fact, assist in obscuring some of the rather ugly buildings on either side in the background, but at the same time it cuts off the heads of the lions. It is easy enough to suggest that a slight adjustment in the position of the camera would have cleared the lions, and so made a real success of the picture, but it is by no means certain that the frame would not then have disappeared from the angle of view; also it may be placed on record that on the click of the shutter the group in the foreground actually did disappear, and what would the picture have been without that?

A Natural Surround.

But while "frames" of architectural details do often serve very good pictorial purpose, it is those provided by Nature which are usually most pleasant. How does it come about that Mother Nature put a tree just near enough to the cottage (in Fig. 2) to provide a photographer with an "interesting" sky just on that one day when the sky happened to be completely blank? The answer is that she did nothing of the sort. The photographer, experiencing the necessity of something for the purpose indicated, looked about him and saw a tree on the opposite side of the road. With this tree he commenced a certain ritual of experiment.

Adjustments.

Standing just under the foremost boughs, he pointed his camera at the cottage, and then walked backwards, perhaps a little to one side and then to the other; then perhaps raising his camera or lowering it. Gradually an outline of boughs came into his view-finder. The farther back he went, the higher he raised his camera, the more of the bough came over the sky. At one point the cottage was probably half-

obscured by the image of the overhanging boughs. Moving to right or left, forward or backward, up and down, every movement was seen to make some definite change in the pattern or amount of the "sky content." When, and only when, the effect seen was such as to satisfy the photographer, or at any rate to satisfy him that no better result could be got, he released his shutter.

Small Movements, Large Changes.

Whenever a case of this sort appears, where the view-finder includes objects both far and very near, it only requires quite a small change in viewpoint to make quite a large alteration in the relative positions of the different parts of the pictures. In Figure 3 for example, where the tree providing the right-hand side of the frame was only a yard or so away from the camera, a pace to the right would have put the sailing-boat behind the trunk and would have brought the boathouse right out into the middle of the framed view. Something—I have forgotten what, but probably something undesirable—would have emerged from its coy seclusion behind the bush on the left to take the place at present occupied by the boathouse.

Fig. 2. The foliage in the sky can be arranged to taste by careful choice of viewpoint.

MULTUM IN PARVO!

There can be no doubt that, clustered together within the walls of "202," there is the greatest stock in Great Britain of second-hand and new miniature cameras of reputable manufacture, and, very probably, the largest stock in the world. We know that where many cameras are concerned, there is a paucity of new stocks available, and if you have had the unpleasant experience of being unable to obtain the new camera you require, we venture to suggest that we, with our wisely stocked shelves, can be of service to you. Our hire purchase and part-exchange terms are extremely fair, and our service unsurpassed. "Try 202 for Service."

LEICAS :

SPECIAL OFFER.

Two only, IIIa Leicas, fitted f/2 Summar lenses, complete with ever-ready cases, purchased by us from H.M. Customs, and guaranteed unused£37 10 0

Leica IIIa, f/2 Summar lens, E.R. case.	As new	£35 10 0
Leica III, chromium, f/2 Summar, E.R. case.	As new	£32 10 0
Leica III, black, f/2 Summar, E.R. case.	As new	£31 10 0
Leica III, chromium, f/3.5 Elmar, E.R. case.	As new	£24 17 6
Leica III, black, f/3.5 Elmar, E.R. case.	Practically as new	£23 17 6
Leica II, chromium, f/3.5 Elmar. Indistinguishable from new		£22 15 0
Leica II, black, f/3.5 Elmar. Good condition		£19 10 0
Leica Standard Model, chromium, f/3.5 Elmar. Indistinguishable from new		£13 10 0
4-cm. f/1.5 Plasmal for the Leica, uncoupled.	As new	£12 15 0
5-cm. f/1.5 Plasmal for the Leica, uncoupled.	As new.	Cost approximately £30.....£14 10 0
3-in. f/1.5 Plasmal for the Leica, uncoupled. Cost approximately £36.	As new.....	£19 10 0

CONTAXES :

Contax Model III, f/2 Sonnar, E.R. case.	As new	£55 10 0
Contax Model II, f/1.5 Sonnar, E.R. case.	As new	£55 0 0
Contax Model II, f/2 Sonnar, E.R. case.	As new	£42 10 0
Contax Model I (this year's pattern), f/2 Sonnar.	As new	£32 17 6
Contax Model I, as above, but fitted f/2.8 Tessar		£25 17 6
Contax, as above, but fitted f/3.5 Tessar.		£23 17 6
Contax, old non-slow speeds model, f/3.5 Tessar. Good condition		£14 17 6
8.5-cm. f/2 Sonnar for the Contax, any model.	As new	£24 17 6
F/8 Wide-Angle Tessar for the Contax.	As new, chromium	£9 17 6
Plate Back with 1 slide for Contax I.....		£2 19 6
Ditto, for Contaflex.....		£3 7 6
Contameter for the Super Nettel.	As new.....	£6 19 6
Contax Universal Finder.	As new.....	£7 17 6
4-cm. f/2 Biotar for the Contax.	As new.....	£13 10 0

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS :

Super Ikonta Model 530/15, f/4.5 Tessar (ideal for colour work).	As new	£13 10 0
Another, as above, but with Rapid Compur shutter.	As new	£14 0 0
Super Ikonta 530/2, f/3.8 Tessar, Rapid Compur.	As new	£16 17 6
Super Ikonta 530/2, f/4.5 Tessar, Rapid Compur.	As new	£13 18 6
Super Ikonta 530/2, as new, f/4.5 Triotar, Klio shutter		£9 17 6
Super Ikonta 530, f/3.5 Tessar, Rapid Compur.	As new	£14 17 6
Super Ikonta 530, f/3.5 Tessar, normal Compur.	As new	£13 17 6
Super Ikonta 530/16, f/2.8 Tessar, Rapid Compur.	As new	£23 17 6

SPECIAL OFFER.

Six only, Super Ikontas 530/2, f/4.5 Tessar, normal Compur. As new£12 7 6
Four only, Super Ikontas 530/15, f/3.5 Tessar, Slightly shop-soiled only.....£18 17 6

MINIATURE CAMERAS FITTED WITH COUPLED RANGE-FINDERS—contd.:

Kodak Regent, f/3.8 Xenar, Rapid Compur.	As new	£13 17 6
Weltur, f/2.9 Radionar, Compur.	As new.....	£13 18 6
Baldaxette I, f/2.8 Xenar, Compur. Shop-soiled only		£15 15 0
Baldaxette I, f/2.8 Xenar, Compur.	As new	£14 10 0
Roland, latest chromium model, f/2.7 Plasmal, Rapid Compur.	As new.....	£20 10 0
Roll-Op, f/2.8 Anticomar, Rapid Compur.	As new	£15 17 6
Dollina II, f/2.8 Tessar, Rapid Compur.	As new	£15 15 0
Dollina II, f/2 Xenon, Rapid Compur.	As new	£15 15 0
Compass, latest improved model, just issued.	As new	£22 15 0

The CONTAX

A very fine camera this! Both range-finder and viewfinder images are seen in the one viewing window and the general specification of the camera is an impressive one. Lenses range from 2.8 cm. to 50 cm. in focal length, and from f/1.5 in aperture. The shutter speeds run from $\frac{1}{2}$ to $\frac{1}{1,250}$ th second, with delayed action, and a very full range of accessories for the amateur or professional is available. Prices from £31 for the Model I with f/3.5 Tessar to £78 5s. for the Model III with f/1.5 Sonnar.

EVEN

though you may have neither the time nor the inclination to do your own processing, it is

ODD

to think that you can have your films developed by superb methods in the very latest Champlin 15, a developer used the world over by "miniature" experts, for the standard charge of 3s. 9d. per Leica size film, and 3s. for V.P. or 120 roll film. This figure, incidentally, includes treatment with Teitel's scratch-proof solution.

If, however, you are at all dubious about Champlin 15, as a result of some of the foolish criticisms we have seen published about it, we can process your films in Sease I, Sease III, Sease III Modified, Paraphenylene-Diamine-Metol, Meritol, or in any other special fine-grain developer capable of giving really excellent results, at the same price.

WRITE TO-DAY for the free booklet, etc., on developing, entitled, "The New Technique in Miniature Film Processing." This will be sent post free by return, together with dispatch envelope, etc.

MINIATURE REFLEXES :

Latest Automatic Rolleiflex 6×6, f/3.5 Tessar, Rapid Compur.	As new	£19 10 0
Automatic Rolleiflex 6×6, f/3.8 Tessar, Compur. Excellent condition		£15 15 0
Latest Automatic Rolleiflex 4×4 cm., f/2.8 Tessar, Rapid Compur.	As new	£19 17 6
Automatic Rolleiflex 4×4 cm., f/2.8 Tessar, normal Compur.	As new	£16 17 6
Rolleicord II, f/3.5 Triotar, ever-ready case.	As new	£14 10 0
Rolleicord II, f/4.5 Triotar.	As new	£11 17 6
Rolleicord I, f/3.8 Triotar.	As new	£11 5 0
Rolleicord I, f/4.5 Triotar, case. Excellent condition		£8 10 0
Pilot Reflex, f/3.5 Tessar, Compur. Excellent condition		£11 15 0
Welta Perfekta, f/3.5 Trioplan.	As new	£10 15 0
Contaflex, f/2 Sonnar, ever-ready case.	As new	£52 10 0
Contaflex, f/1.5 Sonnar, ever-ready case.	As new	£62 10 0
Lever-wind Exakta Model B, f/1.9 Dallmeyer Super-Six, improved type.	As new	£26 10 0
5.5-cm. f/8 Wide-Angle Tessar Lens, for the Exakta.	As new	£9 15 0
Exakta Model B, lever wind, f/2.8 Tessar.	As new	£22 17 6
Rolleiflex Accessories: Plate Back, 18s. 6d.; Slides, 11s. 6d. each; Light and Medium Yellow Filters, new type, 10s. 6d. each; old type, 8s. each; Focusing Screen, 11s.; Sunshade in purse, new type, 10s. 6d.; old type, 6s. 6d.; Proxars 27s. 6d. per set; Angle Mirror, 27s. 6d.; Iris Stop, 17s. 6d.; Stereo Attachment, 18s.; Panorama Head, 14s. 6d.		

MISCELLANEOUS CAMERAS :

Retina, f/3.5 Xenar, Compur.	As new	£6 17 6
Dollina II, f/2 Xenon, Rapid Compur.	As new	£15 15 0
Beira, f/3.5 Trioplan, Compur.	As new	£6 17 6
Miniflex, f/3.5 Astro, Compur.	As new	£6 17 6
Miniflex, f/3.5 Victor, Vario shutter.	As new	£2 7 6
Ensign Mulex II, chromium, Ross Xpres f/2.9, purchased new 10 days ago (receipt shown).	Cost	£26 10s.
Peggy, f/2.7 Plasmal, coupled range-finder, film-cutting device.	As new	£19 10 0
Peggy, f/2.8 Tessar.	As new	£20 10 0
Peggy, as above, but with 4 cassettes, filter and E.R. case.	Cost £36	£21 17 6
21-cm. f/6.3 Tele-Makina Lens for above.	As new	£8 15 0
Kodak Six-20 Duo, f/3.5 Kodak lens, Compur		£7 17 6
Dolly Super Sport, f/2.8 Xenar, 3 slides and focussing screen		£9 17 6
520 Ikonta, f/3.5 Tessar, Rapid Compur, case.	As new	£9 17 6
Voigtlander Virtus, f/3.5 Heliar, case. Excellent condition		£8 17 6

CAMERAS TAKING 16 on V.P. FILM :

Zeiss Kolibri, f/3.5 Tessar, Compur. Good condition		£6 17 6
Plaubel Makinette, f/2.7 Anticomar. Good condition		£10 17 6
Baby Ikonta, f/4.5 Novar, Derval. Excellent condition		£3 3 0
Voigtlander Perkeo, f/3.5 Skopar, Compur. Good condition		£5 15 0
Piccochic, f/2.9 Vidanar, Compur. Good condition		£4 7 6
Pupille, f/3.5 Elmar, Compur. Good condition		£9 9 0
Pupille, f/2 Xenon, Compur. Excellent condition		£13 17 6
Reflex Attachment for the Pupille. New condition		£2 5 0

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1 (HOLBORN 4780.) (Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

COLOUR the new thrill in snapshots..

Natural colour without filters or attachments, at exposures well within the scope of small-aperture lenses—that's the story of the new Dufaycolor film! For example—in the middle of a sunny summer day, $1/25$ sec. at $f/8$ gives a perfect Dufaycolor picture of any ordinary subject. Dull days, though they need longer exposures, give equally good results.

You can buy Dufaycolor films in all standard sizes, including 35 m.m. film for miniature cameras. Sub-standard cine film (used with filter) is also made.

Development and finishing services are provided by us, the film being sent to us by your local dealer. And finally—any number of black-and-white prints can be made in addition to the original colour transparency.

Start putting natural colour into **your** pictures!
From now on, load with DUFAYCOLOR!

Send for this book

The full story of Dufaycolor, with detailed exposure guides, and instructions for processing etc., is contained in the book "The Dufaycolor Book" (post free, 8d.) For this, or any other information, please write to Dufay-Chromex Ltd., 14/16 Cockspur Street, London, S.W.1.

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Best Results in Summer-time Projection

By S. E. L. M.

PERFECT shows can obviously be given only under ideal screening conditions. To begin with, it is necessary to exclude all light which is able in any way to degrade the quality of projection, and, before we proceed further, we had better face up to the fact that this can seldom be accomplished without restricting ventilation in the selected apartment.

Now, throughout all the summer months, we cannot comfortably endure even a short spell of stuffiness. Hence the perfect show also requires efficient ventilation—unusually efficient ventilation.

Between these two things, then, a compromise has to be struck. Simple light-traps can be made to keep out most of the light . . . electric fans can be used to encourage the free flow of air. In addition to these, actual window screens (arranged on the Nightingale-board principle) may be employed both to exclude light and to ensure a constant change of atmosphere. Where it is not desired to make special screens, much can be done by making full use of pelmets, draw-curtains and existing draught-screens, the last of which may be arranged actually to create air circulations.

Equipment.

Attention should next be turned to the projector. This must be made to operate at the maximum possible efficiency. Thorough cleaning alone does not ensure this; it is necessary also to load the lamp filament to its full capacity and to use a shutter operating with the most brief "cut-out" action.

The frame of the film-gate should be kept particularly clean, and it is also advisable to use a short-focus lens. Immediately before projection, both exposed surfaces of the lens should be cleaned with a proper polishing cloth—a simple treatment which can easily add thirty per cent to the value of screen illumination.

Considering, now, how any murky atmosphere can dissipate the strength of the light beam, a request for visitors to refrain from smoking will make for a further increase in efficiency.

The Screen.

Most important of all, however, is the matter of the screen. It is now that many amateurs fully appreciate the weaknesses of their winter screens—though even the best ordinary screens

cannot be expected to give perfect results under conditions of summer-time projection. Many of such screens are far too large for permanent use in a semi-darkened room . . . and many, again, lack adequate "shielding" to protect the high surface from extraneous light-beams.

For these reasons, it is important to acquire a special screen designed for working under the fairly exacting conditions which now prevail.

The maximum surface size for all screens intended to be used at shows given in ordinary apartments should be in the neighbourhood of 60×45 in. A highly-reflective bead surface must also be regarded as something which is essential to the perfect show. These screens are readily obtainable from the firms specialising in ciné accessories, and full particulars of a material so surfaced were published by *The Amateur Photographer* in an issue dated November 11th last.

Finally, the screen should embrace a four-piece protective light-shield, ar-

ranged as shown in the accompanying illustration. In the absence of a theatre "cave," such an arrangement is absolutely essential to all good projection.

And since the shield may consist of four pieces of blackened plywood board—each hinged to fold flat behind the screen proper—difficulties of storage are seldom likely to occur.

Where the sun is shining. The ciné camera is the ideal recorder of holidays for the amateur, and every incident of every day gains interest by being photographed in action.

Trucking Shots

By

PETER LE NEVE FOSTER.

PRACTICALLY every film one sees in the theatres contains a shot from a moving vehicle or one which appears to have been so taken. Technically such scenes are termed "trucking shots." Amateurs, however, do not appear to have learned their value, or perhaps are unable to make suitable apparatus for moving the camera.

These shots can be divided roughly into two kinds. Those which are, obviously, taken from a moving train or moving car, and those in which the camera moves slowly down a long passage or similar place where it is evident that no car could go, and where the movement of the camera is obviously artificial and inserted for dramatic effect or reasons of continuity.

Shots of the former kind are easy to take in that the necessary vehicle is usually easily obtained, but are extremely difficult in that they often look terribly "jumpy" on the screen.

Scenes from railway carriage windows are fairly easy, provided that one does not let off the camera (or drop it out of the window) just as the train is going over points. It is also desirable to point the camera either forwards or backwards or in any direction rather than at right angles to the direction in which the train is travelling, otherwise the result will be a horrible blur. Jumpiness can be minimised by holding the camera clear of any solid supports, such as window frames, which might transfer the vibration of the coach to the camera.

Filming from a motor car is a much more difficult operation, as every time the car goes over a bump, the camera gives a jump that is most disconcerting when seen on the screen.

However, if one uses a well-sprung car and drives fairly slowly over a good bit of road, results can be obtained, and as a rule they are quite worth the trouble involved. The remarks about holding the camera and pointing it straight ahead apply just as much here as they did to railway carriages.

Whether or not one should shoot through the windscreen appears to be a debatable point. I have seen pictures, taken through the glass windscreen of an ordinary car which looked no different from any other pictures. On the other hand, I have been told that pictures taken through triplex glass come out as if they had been shot with a 4x filter. Yet other people say that you should open the screen wide and never take through the glass under any consideration. The truth of the matter probably is that there is glass and glass, and that the safest course is, therefore, to open the screen wide.

The second type of trucking shot is only applicable to studio-made films and calls for the use of a little trolley on which are mounted the camera and operator who can be pulled and pushed about the studio floor as required. The points to watch are that the trolley runs evenly, that the floor is smooth and level and that the camera is not moved about too quickly.

The Week's Meetings

Wednesday, August 4th.

Partick C.C. Receiving Date for Prints for Criticism.
Worthing C.C. Outing to Clapham Woods.

Thursday, August 5th.

Hampshire House P.S. "Photographic Modernism." A. A. Burall.
Kinning Park Co-op. C.C. Criticism of Holiday Prints.
Oldham P.S. Print Portfolio—Miscellaneous. F. M. Sutcliffe.

Friday, August 6th.

Photographic Society of Ireland. Informal Meeting.

Saturday, August 7th.

Accrington C.C. Hacking Boat and Hurst Green.
Bristol P.S. Iron Acton.
Hackney P.S. Outing to Waltham.
Hornchurch P.S. E. Horndon—Herongate—Brentwood.
Kinning Park Co-op. C.C. Campsie Dam. Mr. Kirkwood.
Letchworth C.C. Great Hormead. H. Meyer.
North-West London C.C. A Tour of the City of London.

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Saturday, August 7th (contd.).

Oldham Equitable P.S. Visit to Assize Court, Manchester. A. E. Petrie.
Photographic Society of Ireland. Visit to Zoological Gardens.
South London P.S. Camberwell. D. E. M. Wright.
Sheffield P.S. Ashford-in-the-Water. J. Mason.
Southampton C.C. Annual Motor Boat Outing down Southampton Water.
Windlesham C.C. Motor Launch Trip.

Monday, August 9th.

Bournemouth C.C. Special Summer Social Evening.
Oldham Equitable P.S. Quarterly Meeting.
Southampton C.C. Amateur Portrait Evening at the Club.
Stourbridge Inst. P.S. "Enlarging." C. W. Mathias.
Walthamstow and D.P.S. Final Print Competition.

Tuesday, August 10th.

Hackney P.S. "Dry Mounting," S. C. Smith; Talk, A. Turner.
Manchester A.P.S. "Toning of Prints." D. F. Brown.

Wednesday, August 11th.

Partick C.C. Print Criticism.

Exhibitions and Competitions

CURRENT AND FUTURE.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, August 31. Rules in the issue of July 28.

The Amateur Photographer Novices' Competition.—Special prizes of supplies of films. Latest date for entries, September 30. Particulars in this issue.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Nuro Competitions.—Cash prizes every month. Special prizes for boys and girls under sixteen. Full particulars obtainable from any photographic dealer, or from Nuro Ltd., Biggleswade, Bedfordshire.

Isle of Man Sixth Annual Amateur Photographic Competition, £300 cash prizes. Open until September 30. (P. A. Clague, Publicity Department, Isle of Man.)
"Daily Mirror" "Nushots" Weekly Photographic Competition. Cash prizes. (The Editor, "Daily Mirror," Fetter Lane, London, E.C.4.)

XVle Salon International de Photographie de Belgique.—Open, May–October. (M. Julien Lejeune, 70, Av. Van Becelaere, Boitsfort, Brussels.)

Northern Photographic International and Open Exhibition, 1937.—Open, June 19–August 21. (W. Whitehead, 8, Bullrodd Drive, Bradford.)

Eighth Chicago International Salon of Photography.—Open, July 15–September 19. (Alex. J. Krupy, Chicago Camera Club, 137, North Wabash Avenue, Chicago, Illinois, U.S.A.)

XXXIle Salon International d'Art Photographique de Paris.—Open, October 2–17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris (9e).)

I International Exhibition of The Photo-Press and

Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Jugoslavia.)

Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Open, September 11–October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)

46th Toronto Salon of Photography.—Open, August 27–September 11. (W. H. Hammond, 2, Gould Street, Toronto, Canada.)

3e Internationale Focus Fotosalon, Amsterdam, Holland.—Open, September 11–26. (Focus, Ltd., Fotosalon, Bloemendaal, Holland.)

Second Western Ontario Salon of Photography.—Entries, August 25; open, September 13–18. (A. E. Adams, 923, Maitland Street, London, Canada.)

London Salon of Photography.—Entries, September 1; open, September 11–October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

First International Competition of Artistic Photographic Pictures, 1937.—Entries, September 1, 1937. ("Camera," Messrs. C. J. Bucher, Ltd. (Publishers), Zurichstrasse, 3/5, Lucerne, Switzerland.)

Fifth Annual Salon, Rockville Centre, N.Y.—Entries, September 1; open, September 11–18. (Dr. M. F. Lee, 74, N. Long Beach Road, Rockville Centre, N.Y.)

Anthracite Salon of Photography, Everhart Museum, Scranton, Penna, U.S.A.—Entries, September 7; open, September 18–October 4. (Salon Director, Everhart Museum, Scranton, Penna, U.S.A.)

The Victorian International Salon.—Entries, September 7; open, October 18–30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Entries, September 20; open, October. (Modern Magyar Fényképezok, VIII, Rákóczi-ut 19, Budapest, Hungary.)

Fourth Canadian International Salon of Photographic Art.—Entries, before September 10; open, October 23–November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa, Canada.)

Sixth Irish Salon of Photography.—Entries, September 25; open, October 30–November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

"Irish Travel" Photographic Competition, 1937. Cash prizes.—Entries, September 30. (The General Manager (Photo Competition), Irish Tourist Association, 14, Upper O'Connell Street, Dublin, I.F.S.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Entries, October 1; open, October 20–November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16–30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15–30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen (Hungary).—Entries, November 20; open, January. (Aszmann Ferenc, Ferenc József ut 27, Debrecen, Hungary.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Rd., Ballard Estate, Bombay, India.)

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

Owing to unexpected pressure on our space this week, the analysis of $3\frac{1}{2} \times 2\frac{1}{2}$ reflex cameras announced for this issue has had to be held over. We apologise for disappointing any readers who may have been looking forward to this illustrated review, for which we hope to find space in a very early issue.

Photographic Societies who are now engaged in drawing up their winter's programmes will be pleased to learn that Messrs. Johnson & Sons, Hendon Way, Hendon, N.W.4, are again offering to send material and data for the following five demonstrations, upon application from the secretaries. "Correct Development by the Azol Method." "Flashlight Photography." "After-Treatment of the Negative." "Toning of Gaslight Prints." "How to do your own Developing and Printing."

Messrs. R. F. Hunter, Ltd., of 51, Gray's Inn Road, W.C., well known as the British agents for the popular Rolleiflex and Rolleicord cameras, are also, as our readers are aware, the makers of the "Celfix" and other extensively used ciné and lantern screens. The sales of these have grown to such an extent that the firm has had to extend its premises and has acquired Nos. 160, 162 and 164, Gray's Inn Road (immediately opposite No. 51), comprising floor space of 2,500 square feet. The new premises will be devoted entirely to the screen side of the business. A new ciné screen catalogue has been issued at the same time. This illustrates fully the outstanding advantages of the "Celfix" and other screens specially made in all sizes, both roller, portable and rigid, for amateur and professional use. A copy of this attractive list will be sent free on request. All correspondence for the firm, however, should continue to be addressed to 51, Gray's Inn Road, as Nos. 160-2-4 are the screen works only.

A novel little flashlamp in a very handy size and form has just been put on the market. This is the new "Geka" Electro-Flash. It is a small cup-shaped container enclosing a supply of the well-known "Geka" smokeless flashpowder. On the base of container there is a screw similar to that on a pocket-lamp bulb, while the open side of the cup is closed with a sheet of thin Cellophane through which the flashpowder can be seen. It screws into a well-made bakelite holder which carries a battery for firing the flash, and is equipped with a switch fitted with a sliding safety cover to prevent premature ignition. Inside the capsule, buried in the powder, is a small fuse which glows when the circuit is completed, and so

fires the powder. On test, we found the response to the switch to be immediate, while the flash is extremely brilliant. The trifling puff of smoke emitted at the moment of discharge vanishes, even in a small, unventilated room, in a few seconds. The instructions include an exposure-table which recommends an aperture of $f/12$ when using a fast panchromatic film on a subject 16 ft. from the flash. The holder costs 4s. 6d., and the electro-flash capsules 10d. each. A supply of these occupy very little space, and can be carried easily in the pocket ready for immediate use. The Geka Flashlamp is imported by Mr. R. E. Schneider, of 46, Farringdon Street, E.C.4.

The Bombay Kodak Fellowship has recently been formed under the leadership of Mr. I. Ismail-Jannmohomed, Hon. Secretary, 1st Floor, The Corner, Nepean Sea Road, Bombay, India. This small enthusiastic band of workers formed the Fellowship to meet the needs of the vast number of less advanced amateur photographers in Bombay. Club membership is growing, and the Society already possesses a library and dark-room. Fortnightly meetings are held, at which more advanced representatives of the leading photographic firms in Bombay are invited to give lectures

and demonstrations and to criticise members' negatives and prints. The Secretary invites amateur photographers in Bombay to send him a postcard, or to call personally at the above address after ringing up 44731.

The Second Western Ontario Salon of Photography will be held in London, Canada, under the auspices of the London Camera Club, from September 13th to 18th, 1937. The last day for receiving prints is August 25th. The exhibition is international, and an entry fee of \$1.00 is charged, which governs four prints. Applications for entry forms should be made to the Secretary, London Camera Club, Box 421, London, Ontario, Canada.

How Much Do You Know? Here are the answers to the questions that will be found on page 144: A. (4), A light-absorbing coating on the back of glass or film, intended to minimise halation. B. (5), Used in the Albumen-Beer process. "The solution is mixed, immediately before use, with an equal quantity of ordinary beer or stout, and floated over the plate. When bottled beer is used" etc., etc. (Abney). C. (2), They may be ignorant of all the rest; they frequently despise them too. D. (5). E. (1). F. (3). G. (5), printing-out paper. H. (3), It is an ordinary filament, run at a voltage above normal. I. (2). J. (1). K. (2). L. (2) (in 1839); (4), Fox Talbot's process, patented 1841; (3) and finally (1), still the basis of all photographic processes to-day.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 x 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is $5\frac{1}{2} \times 3\frac{1}{2} \times 3$ and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

86. Makers' Formulæ : Developers for Criterion Papers—(2)

Developer for Mezzotone Warm-Tone Paper.

Metol	2½ grs. (0.3 grm.)
Hydroquinone ..	45 grs. (5 grm.)
Sodium sulphite (anhydrous) ..	120 grs. (12.5 grm.)
Potassium metabisulphite ..	15 grs. (2 grm.)
Sodium carbonate (anhydrous) ..	130 grs. (13 grm.)
Potassium bromide ..	15 grs. (2 grm.)
Water up to ..	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take 240 grs. (25 grm.). If crystallised carbonate is used, take 360 grs. (37.5 grm.).

For normal warmth of tone, use above developer undiluted at 65° Fahr., and adjust exposure to make development complete in 120 secs.

For warmer tones, dilute developer with twice its bulk of water, or add extra potassium bromide, and increase exposure accordingly. Development will then be proportionately prolonged. Greater warmth of tone can be obtained by adding further bromide, increasing the exposure, and raising

the temperature of the developer to 68° Fahr. Development should be complete within 3 mins.

Developers for "D. and P." Gaslight Paper. M.Q.

Metol	15 grs. (1.7 grm.)
Hydroquinone ..	55 grs. (6.25 grm.)
Sodium sulphite (anhydrous) ..	220 grs. (25 grm.)
Sodium carbonate (anhydrous) ..	245 grs. (28 grm.)
Potassium bromide ..	5 grs. (0.5 grm.)
Water	20 oz. (1,000 c.c.)

Amidol.

Sodium sulphite (anhydrous) ..	220 grs. (25 grm.)
Amidol	55 grs. (6.25 grm.)
Potassium bromide ..	2½ grs. (0.25 grm.)
Water	20 oz. (1,000 c.c.)

In either of the above formulæ take double the weight of sulphite if the crystalline form is used. If crystallised carbonate is used in the M.Q. formula, take 660 grs. (76 grm.).

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Exhausted Developer.

I recently developed four films in succession with 2 oz. of fine-grain developer. The first was perfect, the second showed a faint image, and the third and fourth were utterly blank. I can only assume either that water carried over from previous soaking had weakened the developer, and so rendered it ineffective, by the time I reached the third film, or that my shutter failed to open when taking the third and fourth films. This seems unlikely as it is in perfect order now. As I much value the subjects taken, I should like to know what I can do.

A. H. M. (Northwich.)

If your query means that you developed a whole spool of film in 2 oz. of developer, and then put through the same developer a second, a third and a fourth film, we are afraid you were attempting the impossible. The developer probably had its work cut out to develop the first film, although it was apparently sufficiently active still to have some slight effect on the second. For the others it was absolutely exhausted, so that, naturally, you got no image. Nothing whatever can be done with the films now.

Cost of Dark-room Equipment.

As I propose to take up photography more seriously than in the past, I should be glad if you would give me the name of a suitable book from which I can obtain a working knowledge of the various processes. I have never developed my own films, so perhaps you could tell me what equipment I am likely to want and about how much it will cost.

R. C. (Palmer's Green.)

We have just published a handbook specially written for beginners like yourself, and we think a copy would be of great assistance to you. It is entitled "Brighter Photography," written by David Charles. Price 2s. 6d. net, or by post direct from our publishers, 2s. 9d.

It is not very easy to suggest any definite cost for equipment. You will soon find out what you require for the work you propose to do, and you can then get prices from catalogues or by quotations from a dealer.

Skies and the Camera.

I have had an inexpensive roll-film camera for some years, and I always get "blank" skies when using it. On my last year's holiday I also took a plate camera and this gave me negatives with quite good skies. I am now thinking of buying a filter or two; in view of my experience with the roll-film camera is it likely to be worth while to get filters for it as well as for the plate camera?

R. F. L. (Lincolnshire.)

The difference in your skies had nothing whatever to do with the kind of camera you were using, but is much more likely to be due to the differences in colour-sensitivity between the plates and films that you chose. Or perhaps you exposed less fully with the plate camera; too full an exposure is inclined to be fatal to skies. If you use panchromatic film and a filter with the roll-film camera, and are careful not to over-expose your skies, you should get more marked skies than any you have yet had. We would also refer you to articles on these topics in our issues of June 16th and July 14th.

Telephoto Supplementary.

I have seen in a catalogue a description of a telephoto supplementary lens said to be suitable for use with hand cameras. Mine has extension enough for focussing to 7 ft.; shall I be able to make use of a telephoto supplementary lens with it? And, if so, do the stop numbers change?

W. P. (Eastbourne.)

No, you will not. A telephoto supplementary lens increases the focal length of the camera lens to which it is attached, and so necessitates extra extension. A long-extension rack-focussing camera is required for this type of supplementary lens, and focussing is then done either on the screen or on a focussing scale marked out by reference to the screen. Since the focal length of the lens is increased and the diameter unaltered, the *f*/number of each stop is increased in the same proportion as the focal length of the lens or the scale of the image.

A Copying Stand.

I intend to make an arrangement for copying by cutting a rectangular hole in a piece of plywood, and mounting lamps all round the back of the opening, through which the photograph would be copied. I intend to use 12 40-watt lamps. How do I wire them up, and will the house wiring take as many lamps as this? W. W. (Coventry.)

There is not the slightest necessity for using so many lamps just to copy a photograph. One lamp at each corner of the board will be ample, and if you reduce the number of lamps to four you need have no fears that your fuses will not stand up to the load. As for the wiring, it is simple; the lamps must be wired in parallel, by which is meant that each must be connected directly to the mains. Wire each, in fact, as though the others did not exist.

Sports Photography.

I hope to make a number of exposures at a sports meeting next month, and I shall take mostly the finish of the races, trying to get the winner breaking the tape. I should like to include the second and third if possible, so I may need some depth of focus. I use a reflex, speeds to 1/1,000th sec., with *f*/4.5 lens. Any hints you can give me will be most welcome.

R. S. (London.)

Some years ago a book was published dealing with this subject only, so that you can imagine there is a good deal to be learned. There is no reason, however, why you should not get some successful results even at your first attempt.

In a general way, you will do well to choose a position where the runners and jumpers are moving towards you, and not at right angles. We should also advise you not to stand too near the subject you want to take, or you will not get sufficient depth of focus, and, although the image will be small when you stand farther away, you will be able to make up for this when enlarging. For rapidly-moving subjects you had better use the full aperture of your lens and give an exposure not slower than 1/200th of a second. For portraits of celebrities and so on you can probably give about 1/25th and use a smaller stop.

One matter that you will find difficult at first is that you have, as it were, to anticipate the moment of exposure. There is a small loss of time between pressing the shutter release and the actual exposure. If you see a runner break the tape and then press the trigger your photograph will show him some distance past the tape. You must work so that the shutter travels while the tape is being broken. The same thing applies to a man doing the high jump. You must press the trigger a fraction of a second before he is above the bar.

Chloro-bromide Paper.

The M.Q. developer I use for bromide paper gives me, I find, a nasty colour on chloro-bromide paper. Can you recommend to me a suitable developer, preferably one that will keep in solution?

A. L. (Stebbing.)

The best thing you can do is to use one of the developers recommended with the particular chloride paper you buy. Only in this way can you rely upon getting the best results that the particular paper will give. All developers except amidol will keep for a reasonable time.

R. G. LEWIS (Ciné), Home Movie and Talkie Experts, 202 High Holborn, W.C.1

WE SPEND

engravers and other tools necessary for the work of overhauling cameras and projectors. No piece of apparatus is displayed or advertised until it has been passed as being in 100 per cent condition, and we are prepared to give a six months' guarantee with every instrument we sell.

In the course of each week our repairs bill amounts to a considerable sum of money. As a matter of fact, we have a special department staffed by expert mechanics and equipped with the most up-to-date lathes, polishers, and other tools necessary for the work of overhauling cameras and projectors. No piece of apparatus is displayed or advertised until it has been passed as being in 100 per cent condition, and we are prepared to give a six months' guarantee with every instrument we sell.

YOU SPEND

When you pay for one of our guaranteed bargains we see to it that you receive good value for your money. As experts, our professional experience and unique knowledge is at your disposal. If you have not the cash in hand to purchase one of the bargains listed below, we suggest that you take advantage of our hire purchase scheme.

BELL & HOWELL.

- 16-mm. Camera 70A, speeds 8, 16 and 24, f/1.8 Cooke Kinek 1-in. focus. Very good condition £18 15 0
- 16-mm. Projector, 200-watt lamp, reverse, still picture device, 2-in. lens, complete with resistance, for all voltages, flex and carrying-case. £18 10 0
- 8-mm. Filmo Double-8, speeds 8, 16, 24 and 32, detachable f/2.5 T.T. & H. lens, carrying-case. Indistinguishable from new. £17 15 0
- 8-mm. Filmo Straight 8, speeds 8, 16, 24 and 32, detachable f/2.5 T.T. & H. lens, de luxe leather case (Agfacolor will be available for this camera shortly). As new £12 10 0
- 8-mm. Filmo Projector, gear driven, 400-watt lamp, still pictures, specially fitted with 1½-in. lens instead of the usual 1-in., with flex, case, etc. As new £31 0 0

KODAK.

- 16-mm. Cine-Kodak BB, American Model, 2 speeds, reflex and waist-level finders, f/1.9 colour corrected Kodak anastigmat lens. Very good condition £16 15 0

● A CHARMING STUDY by PETER CLARK

This interesting study is a good example of the way in which portraits taken with Taylor-Hobson lenses accomplish not only a perfect reproduction of the subject, but a life-like realism that literally "breathes." For quality of tone and detail, Taylor-Hobson lenses are unequalled. Ask for them by name.

... TAKEN WITH A

TAYLOR-HOBSON LENS

TAYLOR, TAYLOR & HOBSON LTD., LEICESTER and LONDON

Just released!

THE NEW BRILLIANT V/6

● STUDY THESE FOUR OUTSTANDING FEATURES :

1. **NEW MOULDED BODY**
of synthetic material which is unaffected by accidental blows, being unbendable and unbreakable.
2. **AUTOMATIC FILM TRANSPORT.**
When the film has been wound the sufficient distance for each exposure, an automatic brake prevents over-winding and ensures correct spacing.
3. **BUILT-IN "HOLD-ALL."**
The side of the camera has a neat compartment to hold Voigtlander filters, focal lenses or Brilliant luminous exposure meter.
4. **SPORTS FINDER.**
The hood can be used as a direct-vision finder for rapid work.

The range of Voigtlander Brilliant cameras has been one of the outstanding successes of recent years. Now, Voigtlander have introduced a new model of this famous design. It is the NEW BRILLIANT V/6, a *de luxe* model incorporating all the good points of the present Brilliants and many other innovations to make your photography still more enjoyable and worth while.

The New Brilliant V/6 weighs 22 oz., and is fitted with f/3.5 Voigtlander Voigtar Anastigmat lens and Compur-Rapid (1 sec. to 1/500th) shutter. The Brilliant Range is now extended from 45/- with f/7.7, to the new V/6 at £9.

USE ILLUSTRA AND BESSAPAN FILMS FOR BEST RESULTS

THE EAGLE EYE OF YOUR CAMERA

A modern precision camera needs a lens of supreme quality to do justice to its own high performance. In other words it needs a Zeiss Tessar. Besides, it takes the rapid Zeiss Tessar lens and its unsurpassed definition, brilliance of image and covering power to secure those wonderful pictures that are ever the delight of your friends. When choosing a new lens or camera see that you get a

—MINIATURE MEN!—

Not Lilliputians—merely users of miniature cameras. As the "Personal" columns have it—"If you communicate with

H. STEAD Miniature Processing Specialist, 4 Gt. Queen St., W.C.2 (2nd door on right from Kingsway)

you will learn something to your advantage." You will learn how to get just that service you have been wanting. Personal treatment by the man himself for those really important films which **MUST NOT BE SPOILED**. Development in your pet developer at a reasonable charge (what you will—Sease—straight P.D.—Merit—Champlin?). **BETTER** enlargements, bringing out all that detail you know to be in the negative. In fact all that care you would give your films yourself if you had time.

You can have your film developed in genuine Champlin's 15 here by the first man to adopt it as a standard developer. A man with already a long experience in using it.

Write, phone, or call, **NOW**.

THE PHOTOGRAPHER'S GUIDE TO BETTER PICTURES

FROM EXPOSURE TO MOUNTED PRINT

By W. F. F. Shearcroft, B.Sc. Hons., A.I.C.

PHOTOGRAPHERS who would be "picture-makers" will find this book full of practical information and helpful hints. It is written in an easy-to-understand manner. There are a number of attractive half-tone photographs, each of which bears on some point in the text. Where diagrams serve to enforce or illustrate a point, these have been included.

148 pages.
(Size $5\frac{1}{2} \times 8\frac{1}{2}$ in.)

"THE A.P." SPECIAL COMPETITION FOR NOVICES

THIS competition is specially for Novices, that is to say, those amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor. The latest date for receiving entries is September 30th.

The copyright of all prints entered remains the property of the authors of the photographs, but the right is reserved by "The A.P." to reproduce the winning prints and any others that may be worthy of mention. The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed to: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less 2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

THIS is the only Amateur Cine House in the country with long professional experience.

OUR ADVICE WILL COST YOU NOTHING, BUT IT MAY SAVE YOU POUNDS.

SHEFFIELD — One minute walk from Town Hall

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to **ILIFFE & SONS LTD., and crossed**

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

[8497]

HOW ROLL FILMS ARE DEVELOPED IN A "CORREX" DEVELOPING TANK

After removing the lid, take out the reel and unwind the apron, then push the end of the apron under the spring of the reel core. The film should now be unrolled in a dark-room and the end also inserted under the spring of the reel core. **PANCHROMATIC** films should be unrolled in total darkness. Orthochromatic films can be handled in a safe red light.

The reel should then be rotated so that the film and the apron are wound up together. The metal spring on the end of the apron will keep the film and apron in position on the reel.

The film, which is now ready for developing, is placed in the tank, the light-proof lid put on, then all subsequent operations can be carried on in daylight.

For testing the temperature of the developing solution, a Correx Thermometer should be used. Fixing and washing can take place in the tank without handling the film.

Both uninitiated amateurs and the skilled photographer will get the finest results from their films if developed in a CORREX tank. The CORREX is not a daylight-loading tank. There is, therefore, no possibility of the film being spoilt through getting it into the tank.

Ask your dealer to show you a CORREX.

"Correx" Tank for V.P. films 25s. 0d.
For 3 1/2 x 2 1/4 in. films.....25s. 0d.
For 4 1/2 x 2 1/4 in. films.....30s. 0d.
"Correx" Thermometer (Fahr.) 3s. 0d.
"Correx" Developing Powders, 6 pairs.....1s. 6d.

V.P. and 2 1/2 x 3 1/2 in. films can be developed in the same Correx Tank if an extra reel and extra apron are used.

Spare Apron, 8s. 0d. Spare Reel, 8s. 0d.

BALDAX

Roll-film camera for 16 pictures, 1½×2½ in., on standard 8-exposure 2½×3½ in. roll film.

Here is a pocketable camera. The precision mechanism and compact design combine to produce perfect pictures. Rapid in use; you just press a button and the camera front springs into position. All-metal body, leather covered, nickel fittings and direct vision view-finder. Direct spring view-finder of two optical units enables quick finding of the picture. Pressure plate holds film in exact focal plane during the exposure. Struts of entirely new design assure a rigid grip upon the lens.

Fitted with

THE VAUXHALL MINICAM

TAKE 12 OR 16 PICTURES
ON STANDARD 3 1/2 × 2 1/2 FILM

FINEST MOROCCO
LEATHER COVERING

Constructed of Metal—NOT Bakelite.
Everybody, including the Press critics who have seen and
tested the new all-metal Vauxhall Minicam, are amazed
at the value. This low price is only possible because of the
fact that we, as sole distributors, import large numbers
direct from the factory in Germany, and, in addition, we
are content to sell at a small profit. If you purchase a
Vauxhall Minicam you will be saving approximately 50
per cent against the price of its nearest competitor.
2 1/2 square or V.P., 1/2.9 anastigmat, £6:19:6
Compur shutter
(Or under our Self-Financed Hire-Purchase Terms of 12
monthly payments of 12/3.)
Ditto, with Prior II shutter..... £5:19:6
(Or under our Self-Financed Hire-Purchase Terms of
12 monthly payments of 10/6.)

ALL THE NEW LEICA ACCESSORIES IN STOCK

New 20-cm. 'TELYT' Lens

33/11 A MONTH FOR 24 MONTHS.

With reflex focussing housing, which opens up new and fascinating fields of photography for the amateur, including: Long distance landscapes; sports scenes, cricket, tennis, athletics, horse-racing, etc.; distant buildings; sections of buildings showing fine architectural detail; "close-up" portraits from 10 to 15 ft. Although the Telyt 20-cm. lens gives you a linear magnification of $\times 4$ over the standard 5-cm. Leica lens, and embodies a ground-glass screen focusing arrangement with $\times 5$ and $\times 30$ magnifiers, it is nevertheless compact and very easily portable.
£37 16 0 cash.

LEITZ f/1.5 XENON LENS 5-cm. FOCUS

30/7 A MONTH FOR 24 MONTHS.

Exquisite definition even at full aperture. Twice as fast as the Summar. Short instantaneous exposures at night and indoors. £34 0 0 cash.

3-YEAR GUARANTEE

All goods we sell costing over £10, new or second-hand, are supplied with a printed three-year guarantee.

SELO

F.P. FILM

Fine Grain Panchromatic

A panchromatic roll film of exceptionally fine grain, for the photographer who wants the highest quality in his work and the miniature camera user — using 35 mm. perforated film — who needs negatives of first-rate enlarging quality.

Made in England by
ILFORD LIMITED, ILFORD, LONDON

Printed in England for the Publishers, LILFEE & SONS LTD., Dorset House, Stamford Street, London, S.E.1, by THE CLASSIC COLOUR PRESS, Reading.

The Amateur Photographer can be obtained abroad from the following: UNITED STATES: The International News Co., New York. FRANCE: W. H. Smith & Son, 248, Rue Rivoli, Paris; Hachette et Cie, Rue Reaumur, Paris. BELGIUM: W. H. Smith & Son, 71-75, Boulevard Adolphe Max, Brussels. AUSTRALIA: Gordon & Gotch, Ltd., Melbourne (Victoria), Sydney (N.S.W.), Brisbane (Queensland), Adelaide (S.A.), Perth (W.A.) and Launceston (Tasmania). NEW ZEALAND: Gordon & Gotch, Ltd., Wellington, Auckland, Christchurch and Dunedin. INDIA: A. H. Wheeler & Co., Bombay, Allahabad and Calcutta. CANADA: Imperial News Co., Toronto, Winnipeg and Vancouver; Benjamin News Co., Montreal; Gordon & Gotch, Ltd., Toronto. SOUTH AFRICA: Central News Agency, Ltd.

"WOODEN COGS"

A *Leica* PICTURE

It is doubtful whether this picture, taken in the turret of an old windmill, could have been photographed with any camera but a Leica. In the confined space it is impossible to set up a tripod and get the whole picture in—you are too near the wheels, your focal length is too long and your depth of focus too little.

LEICA SOLVES THE PROBLEM

By crouching against the wall, and using his Leica camera, with 3.5-cm. wide-angle lens and a flashlight, the photographer got this remarkably successful picture. Leica photography opens up new possibilities.

Ask your photographic dealer to demonstrate the full possibilities of Leica photography, or descriptive literature will be sent on request from:

E. LEITZ (LONDON), 20, MORTIMER STREET, LONDON.W.1

Panchromatic quality, widest tone gradation, freedom from grain and halation — these are the photographic properties of the accompanying picture, taken on

"Happy Holidays" Competition

HERE'S A SUBJECT 'BOUNDING WITH
POSSIBILITIES FOR GOOD SNAPSHOTS

It gives you an opportunity to make money, while enjoying your holiday. Take them bathing, making sandpies, riding the donkeys, chatting with the seaside clown. There are hundreds of ways of portraying the holiday spirit. Of course, the photography must be GOOD—it's THAT by which your efforts will be judged. Any amateur may enter, using his own choice of camera and materials.

GO IN NOW AND WIN!

**£25
FIRST
PRIZE**

WALLACE HEATON COMPETITION

COUPON to be affixed to each entry. Valid until
Competition closes on September 30th, 1937.

Enclosed is my entry for "....."

Competition. I agree to the rules and conditions.

Camera used

Signed

THE RULES ARE SIMPLE:

All entries to be judged by Wallace Heaton Ltd., whose decision shall be final. **AMATEURS ONLY** (Full name, address, title of entry and coupon on back of each entry). **ANY MAKE OF CAMERA or MATERIALS. DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE, MOUNTED OR UNMOUNTED** (not less than 8 x 6 unmounted is recommended).

WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6. (If a guinea prize-winner for an extra guinea.) Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.

Prizes are 21/- each week and 6 Certificates of Merit. £25 (Twenty-five pounds) for the best photograph submitted during the competition (13 weeks).

If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made and no entries will be returned unless above is complied with. Acceptance of these rules, etc., is a condition of entry.

"SUNBATHING COMPETITION." Last week's winner was—

Mr. George Cuthrie, "Capitol Theatre," Queen Street, Cardiff, S. Wales.

Address your entries now, to "Happy Holidays" Pictures,

WALLACE HEATON LTD., 127, NEW BOND STREET, LONDON, W.1

This picture was taken with a Dallmeyer lens.

A selection of the best entries will be held back at the close of the competition for exhibiting in our galleries prior to their return. Our gallery is **ALWAYS** interesting, call and see it when in Town—Free, of course.

The friendly way of Buying Out-of-Income

THE WESTMINSTER Plan of Purchase Out - of - Income is *different*, because it eliminates all needless formality, offers the widest latitude in regard to terms, particularly generous treatment in PART EXCHANGING, and—most important consideration of all—it comprises, *as a right*, a measure of CUSTOMER

PROTECTION, which secures that a serious disadvantage present in many schemes is entirely absent from all transactions with the WESTMINSTER. With the Westminster there are no third parties to cause complication and delay—but a direct and friendly dealing, in which your interests are specially safeguarded and your complete satisfaction assured.

11-in. $\frac{1}{5.5}$ Teleros, in focussing mount £10 7 6
12-in. $\frac{1}{6}$ Series X No. 2 Adon £5 5 0
12 $\frac{1}{2}$ -in. $\frac{1}{5.6}$ Cooke Series VIII £8 17 6
12 $\frac{1}{2}$ -in. $\frac{1}{6.3}$ Tele Tessar for Miroflex £10 15 0
10-in. $\frac{1}{5.6}$ Dallin, in special mount for N. & G. folding reflex £9 10 0

WESTMINSTER "VICTORIA"

Ultra-Modern Roll Film Camera, for 16 pictures 2 $\frac{1}{2}$ x 1 $\frac{1}{2}$ on normal 3 $\frac{1}{2}$ x 2 $\frac{1}{2}$ spool. Specially strong scientific one-piece construction. Quick self-erecting front, with $\frac{1}{2.9}$ Steinheil Cassar anastigmat, focussing mount. Particularly efficient optical finders. Quick and easy loading, panchromatic safety covers.

Model I, Compur Rapid shutter, 1 to 1/400th sec., T. and B. and delayed action, release on camera body. £7:19:6

12 monthly payments of 14/-, 24 of 7/-
Model II, with Normal Compur shutter, 1 to 1/250th sec., T. and B. and delayed action, release on camera £6:15:0

12 monthly payments of 11/10, 24 of 5/11.
Model III, with Frontor II shutter, 1 to 1/150th, T. and B. and £4:19:6

AGFA KARAT

Special $\frac{1}{6.3}$ anastigmat of very fine quality. Shutter gives speeds of 1/25th, 1/50th, 1/100th sec. and B., carefully designed for simplicity and maximum results. Automatic film wind renders double exposures impossible; easy loading with self-threading. Most efficient and accurate £5:5:0
12 monthly payments of 9/2.

LATEST ENSIGN SELFIX "220" . . .

This camera, noted as a pioneer of the self-erecting principle in the inexpensive camera, is now offered in a new form, taking 12 pictures 2 $\frac{1}{2}$ x 2 $\frac{1}{2}$ or 16 2 $\frac{1}{2}$ x 1 $\frac{1}{2}$ at option. Direct optical finders, adjustable to either size, mechanical film counter similarly adaptable, focussing and depth-of-focus scale and most handsome lustre chromium finish.

F/7.7 Ennar anastigmat, Trichro shutter, speeds 1/25th, 1/50th, 1/100th, T. and B. £2:15:0
F/6.3 Ennar and Trichro shutter. As above £3:5:0

12 monthly payments of 5/10.
Ennar $\frac{1}{4.5}$ anastigmat and Trichro shutter £3:15:0

12 monthly payments of 6/8.
Ennar $\frac{1}{4.5}$ and Frontor II shutter £5:15:0

12 monthly payments of 10/1, 24 of 5/1.
Zeiss Tessar $\frac{1}{4.5}$ and Compur shutter £9:15:0

12 monthly payments of 17/1, 24 of 8/7.

New INEXPENSIVE ROLLEICORD Model Ia

Gives the usual Rolleicord picture 2 $\frac{1}{2}$ square (12 on normal 3 $\frac{1}{2}$ x 2 $\frac{1}{2}$ spool), and comprises most of the noted Rolleicord features.

With $\frac{1}{3.5}$ Zeiss Triotar anastigmat, Compur shutter, 1 to 1/300th sec., T. and B., automatic film winding, metal body with leatherette covering.

£12:10:0

12 monthly payments of 21/11, 24 of 11/-.

NEW 2 $\frac{1}{4}$ sq. Model ZEISS IKON IKONTA

Most recent addition to the Ikonta series, giving 12 pictures on usual 8-exposure 3 $\frac{1}{2}$ x 2 $\frac{1}{2}$ spool. 100 per cent self-erecting, and with shutter release on camera body.

F/4.5 Novar, in delayed-action Telma shutter, 1/25th to 1/125th £6:12:6

12 monthly payments of 11/7, 24 of 5/10.
F/4.5 Novar, in delayed-action Klio shutter, 1 to 1/175th sec., T. £7:5:0

12 monthly payments of 12/8, 24 of 6/4.
F/3.5 Novar, in Compur shutter, 1 to 1/300th sec., T. and B. £9:10:0

12 monthly payments of 16/8, 24 of 8/4.
F/3.5 Tessar, in Compur Rapid, 1 to 1/500th sec., T. and B. £13:0:0

12 monthly payments of 22/9, 24 of 11/5.

VOIGTLANDER

BRILLIANT—New Model

A highly popular camera now offered in new de luxe form. Body moulded of special unbreakable material, comprising built-in hold-all for filters, supplementary lenses, etc. Takes 12 pictures 2 $\frac{1}{4}$ square on normal 3 $\frac{1}{2}$ x 2 $\frac{1}{2}$ spool. Automatic film wind prevents all risk of overlapping. Lens, $\frac{1}{3.5}$ Voigtar in Compur Rapid shutter, 1 to 1/500th sec. A special "sports" direct-vision finder greatly facilitates rapid working.

£9

12 monthly payments of 15/9, 24 of 7/11.

NEW**Compass****ACCESSORIES**

Here are four NEW accessories that add to the scope and convenience of the Compass — the precision, miniature camera.

THE COMPASS ROLL FILM BACK

Takes the place of the normal hinged back of the Compass Camera and enables six-exposure roll films to be used. Positive one-turn-per-picture winding, retracting pressure plate. Increases the thickness of the Camera only $\frac{1}{8}$ inch. Two six-exposure spools now retailing at 1/5d.

Compass Roll Film Back - - £5.0.0

THE COMPASS POCKET TRIPOD

The Compass Pocket Tripod has been designed to occupy the minimum of space whilst giving the maximum of efficiency. Its construction enables it to be carried in the pocket like a fountain pen, and to be brought into action very speedily, with alternate heights of 9 in. and 12 in. and with an easily adjustable ball and socket head which enables the camera to be pointed and fixed in any direction or at any angle.

Compass Pocket Tripod - - - £2.0.0

**THE COMPASS CARRYING CHAIN**

On occasions when the Compass Camera is in constant use the Carrying Chain enables it to be suspended round the neck and to be manipulated with the greatest of ease.

Chrome-plated Snake Chain. Complete in leather purse 12/6d.

**THE COMPASS CABLE RELEASE ATTACHMENT**

The Cable Release, especially valuable when the camera is used on a Tripod, simple bayonet attachment.

Complete in leather case - - - 7/6d.

COMPASS CAMERAS LTD., 57, Berners St., LONDON, W.1

TAKING IT IN COLOUR ?

SEE the difference with a **PAILLARD** CINE CAMERA

The Paillard takes really outstanding colour films because it has a 200-degree shutter giving a large aperture passing very close to the film and thereby giving a high proportion of exposure time which augments the luminosity of the lenses.

YOU CAN ALSO CHANGE FROM MONOCHROME TO COLOUR (OR VICE VERSA) BEFORE YOUR SPOOL IS FINISHED.

This is a point of great importance, because one rarely wants to shoot a colour film straight off. With the Paillard all you have to do is to note footage on the precision indicator and then rewind film by means of the reverse hand wind. The self-threading mechanism of the Paillard makes it easy to slip in a new spool. Spools can be changed over as many times as you wish without inconvenience, because the whole operation only takes a few moments.

This is only one of the many refinements which enable us to claim that the Paillard gives the best results and the widest filming scope.

Other Refinements include: Critical visual focuser. Special tri-focal view-finder giving parallax correction down to 2 ft. In spite of its compactness the turret head has wide spaced lenses so that the field of wide-angle lenses (F 15 mm.) is not interfered with by telephoto lenses. Variable speeds —8 to 64 and all intermediate. Possibility of filming backwards for whole length of 100 ft. film being taken up and the counter subtracting exact amount (indispensable for superimposition, lap dissolves, etc.). Picture-per-picture device, "time" and instantaneous exposures from 1/10th to 1/50th sec. Obtainable in three models for 9.5-mm., 16-mm. and double-8 films. With critical visual focuser and Dallmeyer f/1.5 Speed **£55:0:0** anastigmat lens.

MODELS FOR 9.5, 16 and DOUBLE-8 FILMS

MADE BY THE MAKERS OF PAILLARD-BOLEX PROJECTORS

Which will it be?

Brilliant pictures—or disappointments? You can make sure of successful photographs every time! Use the 'Avo' Exposure Meter—the simplest photo-electric meter on the market. It tells you at a glance the correct stop and shutter speed to use for the light prevailing at the actual moment of taking the photograph. No complicated scale. Correct exposure indicated instantaneously and clearly.

A USER WRITES:

"I recently purchased one of your 'Avo' Exposure Meters and find it most useful and accurate."

(Signed) D. T. N. (Harpenden).

PURMA SPECIAL

NO FOCUSING TO SET

NO LENS APERTURE NO CALCULATING

You just hold the camera up and shoot—as simple as that—and as quick. The highly efficient all-metal focal-plane shutter has 3 speeds capable of dealing with poorly lighted subjects up to the quickest action. The speeds are $1/25$ th, $1/150$ th, and $1/450$ th sec. The adjustment of speed is automatic—decided by one of three ways of holding the camera. The $f/6.3$ anastigmat lens, made and guaranteed by Beck, gives clear, crisp definition over the whole picture area. Gives 16 pictures on ordinary vest pocket film for 1/-. The Purma Special opens up a wider range of photography. No need to wait for people to pose, or for the sun to come out, or even for the rain to stop. Just go out with your Purma Special and shoot. Ideal for the beginner in miniature photography.

ONLY 50/-

Purma portrait attachment 3/6
Ever-ready leather carrying-case with shoulder strap 10/6
Carrying sling 2/6

Actual size of Purma Special picture taken in the Mall, Feb. 1st, 1937, 11.15 a.m. Winter sunlight. Pan. film, med. speed.

CORONET CAMERA CO., DEPT. A10, BIRMINGHAM, 19

It shall advantage thee more than ever —"TWELFTH NIGHT"

Since it was on the photographic mart,
For men of critical persuasion placed,
This Mezzotone hath with a warm black tone,
By simple straight development o'ercome
Cold black and white's austerity in print.
Moreover, by its bromide like celerity,
Enlargements can be made as easily
As contact prints. Long-scaled gradation plays

Its valued part to render faithfully
Each tone of light or shade. And latitude
Exceptionally potent doth adjust
Exposure errors in the finished print.
**Now to this tale of virtues told in part
Add this, that Mezzotone doth now enjoy
A price advantage. It costs no more to-day
Than Bromide paper of the standard sort.**

The Rolleicord saves you the expense of enlargements because contact prints are large enough to show the fullest detail of your pictures. 12 pictures on 3½×2½ 8-exposure roll film for 1/-. The separate viewing lens and focussing screen eliminates useless snapping because you see your picture full size and right way up, therefore you can reject all subjects which do not appeal to you before you have wasted film on them. The high-class Zeiss Triotar lens will not only give you perfect holiday pictures, but will give excellent results all the year round. The Compur shutter is speeded from 1 to 1/300th sec., also T. and B., and is set and released by one lever. The Rolleicord is so designed that it is easily manipulated. Takes all Rolleiflex accessories except only the angle mirror.

With Zeiss Triotar f/3.5 lens and Compur shutter, speeded to 1/300th sec., T. and B. £16:10:0

With Zeiss Triotar f/4.5 lens and Compur shutter, speeded to 1/300th sec., T. and B. £14:10:0

There is also the new Rolleicord Ia. With Zeiss Triotar f/4.5 lens and Compur shutter, speeded to 1/300th sec., T. and B. £12:10:0

Rolleicord YOURS FOR 6d. A DAY

With Zeiss Triotar f/3.5 lens, 24 monthly payments of 14/10, or 15 monthly payments of 23/2.

New Rolleicord Model Ia, 24 monthly payments of 11/3, or 15 monthly payments of 17/6.

"EXCHANGE ALLOWANCES—MORE THAN DOUBLE"

Sydenham.

"I am very pleased indeed with the Rolleiflex you supplied me. It is a beautiful camera. The exchange allowance you granted on my old camera was also in excess of all other offers I had. Indeed, in one case it was more than double."

C. P.

Wolverhampton.

"I received the Rolleicord on Saturday and I must say I am delighted with it. I have given it a test this week-end under terrible weather conditions and the results are simply wonderful."

THE EAGLE EYE OF YOUR CAMERA

A modern precision camera needs a lens of supreme quality to do justice to its own high performance. In other words it needs a Zeiss Tessar. Besides, it takes the rapid Zeiss Tessar lens and its unsurpassed definition, brilliance of image and covering power to secure those wonderful pictures that are ever the delight of your friends. When choosing a new lens or camera see that you get a

THE *Voigtländer* BESSA gives you a great deal for your money —

The Bessa has been described as "two cameras in one," because the mask for half-size pictures enables you to take 16 photographs on $3\frac{1}{4} \times 2\frac{1}{4}$ film, instead of the usual 8 if you wish. With the famous "3-point" system of focussing, shutter-release fitted under the baseboard and high-grade Voigtländer Anastigmat lens, the Bessa is a camera you should know all about.

● Write to-day for the Brochure which fully describes the Bessa range. Models from 52/6 (as illustrated) with F/7.7 lens, to £9 12s. 6d. with F/3.5 lens and Compur-Rapid shutter. **52/6**

The NEW SUPERSENSITIVE METER

Gives direct readings in relatively dark interiors as well as very bright exteriors. Scale clearly shows readings, from 1/1,000th sec. to 4 minutes. The "Sixtus" has no tables, yet it is capable of use with any film from 6 DIN. 17° Scheiner to 21 DIN. 32° Scheiner and with lenses from F/1.4 to F/45. It is self-contained in bakelite ever-ready case from which it is not removed when in use. Weighs 5 oz. and measures $2\frac{1}{2} \times 2 \times 1$ in.

Price 5 gns.

FOR THE LEICA

A model specially calibrated, covering the individual shutter and iris readings, is now obtainable.

Price 5 gns.

Further details on request from

Phone: Museum 6022-3-4

Agfa 12-exposure cassettes are supplied in Isochrom F film at 1/5 or Isopan F film at 1/7. Just drop the cassette in the camera, pull out sufficient film to engage the sprocket, clip down, shut the camera and you're ready.

When exposed you will find the film has wound itself into the opposite cassette, which just lifts out and is ready for developing. Enlargements from these negatives $3\frac{1}{2} \times 2\frac{1}{2}$ 2/- per dozen. Strip prints $2\frac{1}{8}$ for 36, or film positives 5/- for 36. Developing 12-exposure cassettes 9d.

HOW LONG DOES IT TAKE TO LOAD YOUR PRESENT CAMERA?

THIS REMARKABLE NEW

Agfa Karat

IS EASILY LOADED WITHIN 10 SECONDS

The Agfa Karat has completely overcome the bugbear of laborious and irritating loading. Imagine the occasions when you have had to miss really good pictures because your camera was empty and there was insufficient time for reloading. 10 seconds is not long, and in that time you are completely set up ready for 12 rapid shots with the new Agfa Karat. This virtue does not by any means stand alone—it has a good f/6.3 lens, snaps out into the ready position at the touch of a button. A shutter speeded to 1/100th sec. Takes 12 exposures on 35-mm. film. An automatic lock prevents double or blank exposures. Automatic picture counter. As the "Miniature Camera Magazine" says, "The Karat is really a remarkable little instrument."

WEDNESDAY, AUGUST 11TH, 1937.

Copyright—Registered as a Newspaper
for transmission in the U.K.

Vol. LXXXIV. No. 2544.

MORE film, we are sure, is exposed during the month of August than in any other month of the year. Shutters are clicking merrily all over the country; on beaches, rivers, broads, and all other places where the world and his wife take their children for the holidays. Mostly these many photographs are just records of holiday activities, and have a value which increases as time goes on and memories of the holiday become dim. But their interest, however great, is strictly limited to members of the holiday party. If they are to have a wider appeal, holiday photographs must possess in addition that more abstract something which gives them a pictorial motive. The theme may be no more than the play of light on a sail, reflection in a calm sea, or a shadow on a whitewashed wall. Or it may be a little nearer the subject of most holiday exposures; one particularly happy child may be caught in an attitude that expresses the joyousness of childhood in general, so making a picture that no longer depends for its appeal on recognition of the individual child. Composition and lighting, and in the case of photographs of people, pose and background too, provide the magic touch that converts a holiday record into a holiday picture.

Washing Soda in Developers.

One of the most famous photographers of about half a century ago was Mr. Paul Lange, for some years President of the Liverpool Amateur Photographic Association. A correspondent who knew him and his methods of working says that he used washing soda with pyro as a developer, and "The A.P." had something to do in the way

TOPICS of the Week

UP ALOFT.

A good example of a holiday photograph made more interesting by being a little out of the ordinary in treatment.

of discovering the formula he used, a formula said to be a secret one. One of Mr. Lange's lectures at Birkenhead Town Hall was reported in the pages of "The A.P." dated January 31st, 1890 (page 67), the report stating that he used a pyro-soda developer for his negatives, then something of an innovation, as pyro-ammonia was in common use. A demand for the formula followed, and Mr. Lange was persuaded to tell how he developed his negatives. He said: "Make up the following stock solution: Boiling water, 16 oz.; washing soda, 2 oz.; bromide, 20 grs. To develop, take $\frac{1}{2}$ oz. of the stock solution, make up to 2 oz. with cold water, and add 3 to 5 grs. of dry pyro. For developing I never use any other. The negatives may not look so nice as black ones (the images were a greenish yellow), but they print, enlarge and reduce (for slides) more excellently." And that was forty-seven years ago!

Seeing the Country.

It seems to have caught the eye of many of the English visitors to the Paris Exhibition how largely the different countries rely on photographs for their "showing off." Even the much criticised British Pavilion is warmly commended everywhere for one thing, namely, its photographs of the pleasantest things in the country. Most of the other countries rely on photographs to attest the progress they are making alike in industry and in the provision of leisure, in art and education and in sport. In the Italian Pavilion one large hall is lined with photo-murals showing incidents of the African conquest, and another has brightly lit dioramas of modern buildings and town-

planning schemes in Italy. Belgium shows attractive photographs of her life and scenery. The Danes show by photographs their scientific industries. Indeed, when one comes to think of it, what other medium is there so stimulating to the imagination and so informative with regard to any subject of considerable extent? Samples can be used, but they are like a sentence with missing letters to every word, whereas photographs furnish a complete description, and one that carries its truthfulness in its very aspect.

Getting the Proper Slant.

An art critic writing in one of the newspapers on an exhibition of "Independent Art" which he has seen abroad makes the remark that the great point about the pictures was that they were not like what they were said to represent, unless you got very drunk so that one eye could get in the way of the other. In these circumstances, he imagined—he modestly disclaimed having made the experiment—the works appeared very fine. It certainly seems to offer an idea for the promoters of art exhibitions, especially art which takes some understanding

before one can realise whether a given picture is a storm at sea or the view of a motor car looking from underneath it. They should have a refreshment room in close proximity to the exhibition, and ply their visitors with the sort of cocktail that makes one's inside feel all lighted up. Hitherto it has been customary only to have refreshments on press day, the Press, of course, needing to have their jaded minds stimulated to appreciation, the exhibition committee forecasting the favourable nature of the notice according to the potency of the drink which is chosen. It may, of course, be that we have missed the point of many pictures, been blind to their excellences, owing to an inconvenient habit of sobriety. The little slant which liquor gives to the perceptions may be necessary for the true appreciation of modern art. Indeed, if, as may have been the case, a picture has been produced "under the influence," it is likely that it can only be appreciated if the visitor is in the same condition. We always bear in mind the true story of a shorthand writer at the law courts who one day took down an important judgment while

drunk, and on returning to sobriety found to his dismay that he could not read a word of what he had written. After a little consideration, however, he got drunk again, and then read it with perfect ease.

Illustrated Books.

Looking round a scientific book exhibition recently, we felt a sudden twinge of envy at the modern student. How different from the schooldays of some of us, when most of our textbooks had no illustrations at all, or at most a wretched little woodcut which obscured more than it revealed. Here, for example, is a new work on X-ray pictures of the bones and joints and it has 340 illustrations. Here is the eighth edition of a standard medical work with 36 coloured plates and over 600 illustrations in the text. Here is another with 400, and so on. Volume after volume of these scientific works was, as the advertisements would say, copiously illustrated, and the adverb was not misapplied. How fortunate is the student to have things made so plain to him that he hardly needs to read anything at all! And the modern block-maker shares in the good fortune.

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Grain in Emulsions.

As grain in emulsions seems now to be such an important matter can you give me some idea of the size of the actual grains of silver bromide in plates and films? L. L. A. (Dumfries.)

Dr. C. E. K. Mees in his book on "Photography" gives some interesting information on the point you raise, and we are pleased to pass some of it on to you.

The crystals in the emulsion itself are mostly flat triangles or hexagons, with a thickness from one-fifth to one-tenth of their diameter. When the emulsion is coated on to a base it contracts on drying to about one-fifteenth or less of its original thickness, so that the grains are flattened out. There may be ten to fifty layers of them in the coating.

To give an idea of their minute size, Dr. Mees says that in a piece of film the size of a thumbnail there are as many grains as there are people in the world. They vary in size so that it would take 10,000 million of some of them to cover a square inch, while others may have a diameter of 1/5,000th of an inch. It requires a good microscope to see even the larger grains.

They can be measured with some accuracy by making a photo-micrograph of, say, 2,000 diameters, and again enlarging this and measuring a large number of the grains. The unit of measurement is a square micron, a micron being 1/25,000th of an inch. In an average emulsion as used for negative-making the largest number of grains have an area of 0.3 square microns, next in order comes 0.1 and then 0.5. As a rule a very fast emulsion contains a greater range of larger size grains, while a slow emulsion is composed almost entirely of grains in the three sizes just named.

Preponderance of small grains, more or less uniform in size, is favourable to securing contrast. Large grains are associated with higher sensitivity and reduction of contrast.

Naturally, as emulsions vary, grain becomes visible at different degrees of magnification. It always exists; and even the most grainless and continuous image possible will reveal its granular character under a sufficiently high microscopic magnification. Recently, great advances have been made in securing fine grain and high sensitivity in the same emulsion.

Double Fixing.

Will you explain the method and purpose of using two fixing baths for negatives instead of one? G. S. (London.)

The method is a simple one, and has the advantage of greater certainty that this important operation is thoroughly carried out.

Hypo solution is poured into two dishes, which we may call No. 1 and No. 2. When the negative is placed in No. 1 it should be noted how long it takes to clear, that is, for the creamy emulsion to disappear. The time varies with different emulsions. Soon after this has happened the negative is transferred to No. 2, where it remains for at least as long as it spent in No. 1.

When it is noticed that the time of clearing in No. 1 is appreciably longer than the time taken when the bath was fresh, this solution is thrown away as exhausted, or nearly so. No. 2 dish (the solution in which has done much less work), now becomes No. 1, and the original No. 1, with a fresh solution, is now used as No. 2.

The Importance of the NEGATIVE

Any experienced worker will agree that one of the most important

parts of the photographic hobby is the production of the negative, and a few points are discussed here which, although probably well known to many, are often overlooked or carelessly neglected.

IT is of little use trying to produce an exhibition picture from a negative which possesses few virtues, so that the production of the negative, especially in these days of miniature cameras, has become of paramount importance.

Not so long ago the plate user was the only individual who had any choice of negative material, the film worker being considered very fortunate in having as much advantage as the orthochromatic emulsion provided him with. Now, however, the varieties of films are legion, and the first perplexity with regard to negative work is the choice of film.

Panchromatic emulsions have come so much into vogue, and are so easily obtainable, that more and more amateur photographers are using them as regular negative material, and this is in most cases all to the good. There are some workers who object to panchromatic material for some kinds of subjects, doubtless on grounds based on experience, but the ordinary general worker will find a great advantage in loading up with this material every time.

Usual Materials.

There is one very important point which every amateur ought to grasp from the onset, and that is, whatever material he may choose to experiment with during his photographic career, he should have a definite choice with which he is so familiar that he can be reasonably certain of turning out a good negative by purely routine methods.

Routine.

If camera drill is important, negative-making routine is equally if not more so, and while many methods are now available, whichever one is decided upon should be perfected.

Such points, for instance, in development by inspection, as the position of the dishes containing each solution. They should invariably be kept in the same order, and usually run from left to right—developer, water, fixer, or desensitiser, water, developer, water, fixer. Thus, the worker finds it quite possible to develop films by hand in total darkness if he has always the

same solutions in the same place, and is relieved from the tragedy of putting his negative into the fixing solution first, which is an event not entirely unknown among amateur photographers.

Developers.

It would be very difficult to run through the numerous developers now available for the negative maker. Different combinations of pyro-soda comprised the old-time worker's chief developer; now he has the choice of dozens. Here, again, it is really essential that the amateur should know exactly what he is to expect from a developer, and is certain, as far as is possible in photography, that his negative and developer are suited.

The miniature worker will almost certainly need a fine-grain solution of some kind, his choice being to a great extent guided by the amount of exposure he has been able to give to his negatives. In this respect, some of the paraphenylene-diamine developers need as much as twice the normal exposure to be successful as fine-grain producers, and the worker must bear this in mind when making his exposures. Variations of the M.Q.-borax or carbonate solutions are extremely useful for negatives made with just normal exposures, especially when excessive enlargement is not contemplated.

This is another factor in the question of negative production, since the kind of enlargement is directly dependent on the type of negative produced.

Tanks.

There is little doubt that the tank combined with the time and temperature method of development is excellent, especially when the worker has decided on a developer and a time which suits his particular type of requirements in the way of negatives.

One or two snags arise: some tanks making objectionable marks, through the touching of the apron, or through unexpelled air-bells, or again through the developer not being sufficiently agitated during development. As is fairly obvious, most of these are not the faults of the tank, but of the operator, and when one considers

that there may be anything up to thirty-six possible exhibition pictures in the tank at a time it behoves one to be reasonably certain that everything has been done to make them perfect.

Handling.

A wet plate or film is not an excessively easy thing to handle, and occasional slips often make awkward marks or abrasions which cause a great deal of annoyance on the subsequent enlargement. There is a lot to be said for the wearing of rubber gloves when handling wet sensitive materials, but most workers object to this and use ebonite forceps, which are at once excellent and dangerous. At all costs miniature negatives should be kept free from blemishes, and it is an excellent plan to clean these films up after the washing with a brief rinse in slightly acidulated water, then rinse again, and wipe off all surplus moisture with a viscose sponge.

Drying.

Quick drying is a very useful thing with regard to the worker who has to do all his photography in his brief leisure. With plates this can be accomplished by soaking the plate in methylated spirit after the final washing, when it will quickly dry. This method, however, is not advocated for films, which should be given a few minutes in a 10 per cent formalin bath and then dried in a current of warm air or reasonably near a fire or stove.

Retouching.

The production of the final negative usually implies some slight retouching. On small negatives the less of this that is necessary the better. The larger negatives can be retouched and spotted fairly easily with the aid of a little retouching medium rubbed over the film (too cheap to make it worth making at home) and a suitable fine-pointed, hard pencil, but the miniature negative is a different problem, and some workers leave them severely alone and rely on their skill being good enough to spot out defects on the final enlargement. The best method is to produce, if possible, the negative without any blemishes.

August 11th, 1937

The Caravan

By HEBER GHYLL.

rainy day provides opportunities of a less stereotyped kind. Calculate the amount of film that you will require and take about four times as much.

Any camera will do, but a miniature will be found most convenient for interiors. Its great depth of focus at a wide aperture is a great advantage in the comparatively confined space of a caravan.

For consistently good results an

The full scenic possibilities of the site should be exploited.

A CARAVAN holiday without a camera is unthinkable, but if the record is to be treasured it must be well planned and carefully made.

It is as well to make a list of subjects which you must include before the holiday starts. You will not forget the start when, with all on board, the venture anxiously takes the road. Then there are a hundred and one "chore" pictures. Mary making the beds. Mother cooking the dinner. Horace washing-up.

You will want records of the site or sites, and do not forget that a

En route.

The milkman.

exposure meter is essential. When taking interiors be careful to test the light on the darkest part of the subject, but do not follow what is perhaps your usual custom of doubling the indicated exposure.

The illumination of the inside of a caravan is very patchy. Brilliant splashes alternate with comparatively dark areas, and the latitude of your film will be no more than enough. If separate treatment can be given it will be wise to curtail the development time of all such subjects in order to keep the contrast within printable bounds.

It is a good idea to lessen the amount of direct light by arranging a sheet outside, but not too close to the windows. Reflectors also made from sheets, will help to bring light to dark corners. Another way to control the light is to slew the whole caravan round.

Some exposures are certain to necessitate the use of a tripod. Make it a stout one and banish everyone not concerned in the picture. A caravan, however well built, is none too steady a platform for photography.

You will be expected to provide many "pretty" pictures

nera AND CARAVAN

showing the caravan in rural surroundings and featuring the members of the party. Very nice—but see that they do their share.

There must be no grinning at the camera. If they are sitting and reading—let them sit and read; if they are just sitting—let them look at the wonderful view or talk to each other. It is far better to stage a planned scene, although your eye

Washing-up.

Getting dinner ready.

As a dark-room a caravan is not a success. If you have to change plates in the dark go very cannily. It is understood that night is the only

mat over the bottom of the door and put the lamp out.

Wait at least three minutes in your alleged total darkness before you uncover any sensitive material. If, however, there is still a faint glimmer of light don't decide to chance it, but take your plates to bed with you.

The user of a plate camera should most certainly equip himself with a film-pack adapter. Dark slides hold at most two plates each, and cannot be reloaded till after dark. Subjects will be so plentiful and so attractive that the plates loaded last night may all be used by lunch time; if so, a daylight-loading film pack will save the situation.

will always be alert for impromptus.

The background should be watched more carefully than usual. No more than at any other time do you want trees growing out of unexpected places. Also a mass of foliage will show off the 'van better than a chalk cliff.

However vividly a light roof stands out against a blue sky, unless you use a filter the two are apt to merge on the negative. The lines of a caravan are distinctive and usually beautiful. Try to make the best of them. The difference of a foot or two in your stance may alter the whole drawing.

One prefers to take the door side, but that does not always offer the same background, or perhaps the lighting is wrong. Here again it may help to move the 'van. Ignore the remonstrances of your unwilling party. When the holiday is over they will be as keen as you to show people the most favourable aspects of the site.

"What's that funny hissing noise?"

possible time. First get everyone either in bed or outside with the clear understanding that no door is to be opened until you say so.

For your preparations choose that part of the caravan with the least windows. Cover them on the outside and draw the blinds. See that all cigarettes are extinguished, place a

Chores!

Readers' Hints, Tips and Gadgets

PHOTOGRAPHING ARTICLES IN PLAN.

IT is often more convenient to photograph small articles on the floor, with the camera held horizontal, than to fasten them to a vertical support and hold the camera in the usual way. The gadget described here enables you to fasten the camera to the tripod with the lens in a horizontal position.

You need a piece of angle-iron about $1 \times 1 \times \frac{1}{8}$ in. The size depends on your camera, but about 12 in. long should do. Two holes are drilled in this. The one for attaching the tripod is a $\frac{3}{16}$ ths-in. hole, which is then tapped with a $\frac{1}{4}$ -in. Whitworth thread. The other is a $\frac{1}{4}$ -in. hole to clear a standard $\frac{1}{4}$ -in. Whitworth bolt. If you cannot do this yourself, a garage would do it quite cheaply.

The tripod screws into one hole and a $\frac{1}{4}$ -in. bolt and nut is put through the other hole and screwed into the tripod socket of the camera. The nut allows the camera to be swivelled into the correct position and then locked by tightening the nut.

In use, the convention of having one tripod-leg under the lens must be abandoned, or the lens will look straight down upon it. The single leg must therefore be at the back, so that the lens looks down into the clear space between the other two. Care must be taken in lighting the object being photographed, or the shadow of one or other of these legs may fall across it.

P. W. BLANDFORD.

AN EXTENSION HOOD.

THE older type of reflex camera had a leather hood which, when erected, fitted closely round the eyes of the user, so excluding all light. Focussing was easy to do, even when the screen was comparatively dark as a result of stopping down the lens. The newer reflexes are too small to accommodate a hood wide enough to enable the photographer to bury his face in it in the old-fashioned manner. Although perfectly satisfactory for general use, a hood that does not fit the face must of necessity allow stray light to reach the screen, so dimming the image considerably, especially when using the camera in the open under a bright sky.

One method of avoiding this difficulty is to make use of the magnifier with which most small reflexes are equipped for fine focussing. In viewing the screen through the magnifier the eye must be brought so close that the head automatically acts as a very efficient sky-shade, and the image is seen at full, or nearly full, brilliance. But although this provides all that could be desired

for the purpose of focussing, it is not very satisfactory for composing the picture, as it is not always easy to see the whole screen at once from so close a viewpoint.

The difficulty can readily be overcome by making a collapsible slip-on extension hood, which shields the screen sufficiently to bring the image up to nearly the brilliance it would have if extraneous light were excluded altogether and at the same time leaves both hands free for manipulating the camera. Such an extension is easily made.

Two pieces of stiff cardboard cut to the shapes shown at A and B respectively form the front and back of the extension, and these are joined together with two side-pieces of stiff paper or American cloth cut as at C. The sides are creased down the centre so that they fold inwards, and the hood collapses flat and can be slipped into the pocket when not in use. The inside should be painted with dead black. The dimensions given are for an Ikoflex camera, but can easily be adjusted for other makes of cameras.

H. BARLOW.

ACCURATE GLASS-CUTTING.

NEITHER the expensive diamond, which few of us possess, nor the cheap and usually inefficient wheel cutter, is a tool that most amateurs can use with accuracy.

Both of them require allowance for the width of the cutter bearing, and a scratch is made perhaps $\frac{1}{16}$ th in. away from the straightedge. Thick glass is difficult to cut at all, and thin stuff often cracks under the pressure.

The use of an old razor-blade against a metal straightedge will give an even scratch on the line desired without any

allowance being necessary for width of tool. The blade should be held at an angle of about 45 degrees, so that the end of the blade only cuts the glass. A single-sided blade with thickened back is best, as it needs no holder and is rigid. But a double-edged blade can be used by placing it between two thin strips of wood clamped by small bolts through the holes.

Thick glass should be scratched on both sides, taking care to get one scratch vertically over the other. Each end of a blade will cut three or four pieces of glass before becoming too dull.

D. E. LUMB STREET.

IN THE SVAAP

William A. Robinson is a specialist in deep-sea small boat cruising! In his aeroplane, Colonel C. A. Lindbergh is a specialist in things aeronautical! On the stage C. B. Cochran is a specialist in showmanship! On the screen, Cecil B. de Mille is a specialist in spectacle! On the links, Henry Cotton is a specialist in golf! At "202" R. G. Lewis is a specialist in miniature cameras and miniature photography!

Presumption, say you, to class ourselves with such a gallery of celebrities? No, say we! They specialise, but no less do we; in fact, the light of our specialisation shines like a good deed in a naughty world when one thinks of the host of imitators who appellated themselves "specialists" when we first gave to English and Colonial miniaturists the incomparable "202 Service."

On investigation, we find that one can call oneself a "Miniature Camera Specialist" if one sells miniature cameras. That, so far as we can see, is all that is necessary for one to become a "specialist." In truth, we feel almost ashamed of ourselves when we confess that we undertake solely the processing of miniature films, the repair and adjustment of solely miniature cameras, the sale of solely miniature cameras, enlargers, and accessories, and the furthering solely of miniaturists' interests. We believe ourselves to be the only firm in the world that can make these claims; if you are a miniaturist, "202" should be your Mecca! "Try 202 for Service!"

R. G. LEWIS, The Miniature Camera Specialist, 202, HIGH HOLBORN, LONDON, W.C.1 (HOLBORN 4780.)

(Two minutes from Holborn Tube Station in the direction of Oxford Circus.)

Look for this sign in
your dealer's window.

Do you know what this is?

It is the shutter release (marked B in the illustration) on the Super Ikonta II, for $2\frac{1}{2} \times 1\frac{3}{8}$ in. and $3\frac{1}{2} \times 2\frac{1}{8}$ in. pictures, conveniently placed on the camera body near the film-winding knob (A); and a nearby signal (C) shows whether the film has been wound on. Therefore, it is impossible to make unintentional double exposures with the Super Ikonta II; even if the shutter has been set it cannot be released until the film has been advanced for the next exposure.

The shutter release is much better situated on the body of the camera than on the shutter itself for this latter position is often a contributory cause to camera-shake. The new Zeiss Ikon shutter release on the camera body facilitates taking pictures from eye-level—where the best perspective is obtained—and practically eliminates the liability to camera-shake.

All Super Ikonta cameras sold in Great Britain or Ireland at current listed prices carry the written three-year guarantee. Ask your dealer for particulars.

SUPER IKONTA

The story of the Super Ikonta is told in our illustrated prospectus "Miniature Camera Advantages with Large Size Negatives". Write to us for a copy.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

A Motor-Cycle Hill-Climb

TAKING A TOSS. 1/200th sec. at f/4.

By W. K. COXON.

near the top, we climbed and climbed. Pulling ourselves up, slipping down, and going up sideways, we eventually did arrive somewhere near the top, when we sat down to get our breath.

However, very quickly the fun started. A quick look at the meter showed that the

AN UNRULY MONSTER. 1/200th sec. at f/4.

TO those who are not interested, riding a motor cycle at speed up an almost unclimbable hill over an impossibly bad track probably seems sheer lunacy. Nevertheless, there are plenty of enthusiasts who thoroughly enjoy it, in spite of possible damage to their mounts. And, in any case, what does it matter to the photographer? Lunacy or rational enjoyment, these hill-climbs provide splendid material for action pictures with the camera.

The illustrations accompanying these notes were all obtained on the same day at a hill-climb in Derbyshire. When we came to the actual course, we could not help thinking that nothing less sure-footed than a goat could ever climb up it at all. What would befall anything on wheels we just could not imagine.

By making friends with a steward

FALLING BACKWARDS. 1/200th sec. at f/4.

the air and rolled over backwards. Before he had rolled very far a long rope with a grab-hook was thrown round the back of the bike, and half a dozen men soon pulled it out of the fairway.

Before this was all really finished and the hook taken off, there was another roar, and up shot another, lost speed, turned on its side, and rolled over down the hill. And so it went on all day—thrill after thrill, and picture after picture.

With all such speed photographs as these, focussing is the chief difficulty; the exposure must be made at the instant that the incident occurs, and there is no telling beforehand at what distance from the camera it will happen. All that can be done is to set the focussing scale so as to cover, as far as possible, all distances from the nearest to the farthest at which it would be worth while to make an exposure at all.

And it needs a miniature to cover such a wide depth of field at an aperture permitting of really high shutter speeds.

FOR THE PUBLIC SAFETY.
The grab-hook that prevents a riderless cycle from running amok.

we obtained permission to roam about the course—with a warning that we ran some risk.

Thinking the best pictures would be

light was good. We fixed the speed at 1/200th sec. and the stop at f/4, just in time for the roar which indicated the first one up—and, strange to say, he was up and over the top, the only one we saw go over all day.

About five minutes' waiting, and then another roar, and up came a second machine in a cloud of dust. He got just about opposite where we were sitting, hit a bump, jumped into

A SUDDEN STOP. 1/200th sec. at f/4.

DANGERS of the BEACH By A.L.M.S.

HOLIDAY snapshots, even if made by a serious worker, are generally casual things, taken on the spur of the moment without thought or premeditation. Yet five years hence they are likely to be more valued than the exhibition pictures on which so much loving care was lavished. All the more reason, then, that every care should be taken that they are at least not

ment a camera is quite out of place, and the photographer's only course is either to put the camera away or to retreat to the other end of the beach. Unless, of course, he cares to risk a rebuff by making suitable diplomatic representations to the parents of the culprits.

Safe Places.

When the camera is out of use, it should never be put down on the sand—not even on wet sand. Deck chairs are common objects of the more inhabited parts of beaches, and most camera cases have a shoulder-strap. Put the camera in its case and hang it by the shoulder-strap to the back of a deck chair, and it should be reasonably safe from sandy contamination. And before opening the case again, brush off any sand there may be outside it.

In a sandy cove away from the crowd it is more difficult to find a spot to put the camera down. If there are rocks, of course, the problem is solved, but in their absence it is a good plan to find a newspaper to stand the camera-case upon. The top of the luncheon-basket is a good place too; none of the party will allow any sand to get into that.

Loading on the Beach.

Loading the camera is always a ticklish operation in sandy surroundings. To get both hands free means sitting down on the sand and putting the camera on the lap, in which position it

Children romping in dry sand make a charming subject, but beware of flying sand.

spoiled by technical blemishes.

The great majority of spots and scratches are caused by dust or grit in the camera body. Sand, beloved by his models the children, is a deadly enemy to the photographer. Not only is it a cause of bigger spots, and worse scratches, than almost any kind of dust or grit, but even a single grain can play havoc with the mechanism of any miniature camera.

Wet Sand and Dry.

The best place for a camera on the beach is in its owner's hand, for he will protect it as instinctively against sand as he would against a blow. And for the photographer himself, when carrying the camera, wet sand is a much safer place than dry, for wet sand does not get flung about as dry sand does. Children running by on dry sand, especially if they turn suddenly just as they pass the photographer, can send up a kind of spray from which it is extremely difficult to protect a camera. Wet sand, on the other hand, does not fly up any more than would grass or a macadam road.

No photographer's offspring, of course, would be allowed to do it—but it is not uncommon to find oneself near children who throw handfuls of sand at one another. In such an environ-

Sand, when wet, loses all its tendency to fly about. Subjects like this may be taken without troubling to protect the camera.

is so near the ground that any passer-by is very liable to fling a few grains of sand into it, quite unconsciously, with his feet. With the camera defenceless through being open, the single grain of sand that can tear a deep channel through all sixteen or all thirty-six exposures as the film winds past, can very easily find its way into a vital part of the "works." The wise photographer

The fine dune sand that would spurt up as these jumpers landed is particularly dangerous to cameras.

will find a spot where he can open his camera in comparative seclusion.

Wind, unless of a most un-August-like strength, does not blow beach sand about to any great extent. Dune sand, on the other hand, is very fine and very light, and care should be taken to protect the camera against sandy dust if it is taken on to sand-dunes on a windy day.

Look after the Case.

Keeping the camera in its case whenever it is not likely to be wanted at an instant's notice is a very great safeguard against the intrusion of the unwanted grain—but only if the case itself is free from sand. It should be inspected every evening, and any little pinch of sand that has found its way in—for sand gets everywhere—should be emptied out to the last grain.

With care, there is no reason why the end of the holiday, even if spent on the sandiest of beaches, should not show a big batch of negatives all completely free from spots and scratches, and a camera that works as sweetly and un-grittily as on the day the holiday started. But if it does not, the photographer can always console himself with a good resolution—to choose a shingle beach next year.

A shingle beach like this, upon which these sun-bathers are lying, completely frees the photographer from all need for care.

Modern Miniature Cameras

THE WELTINI.

THE Weltini, which is a range-finder camera giving pictures 24×36 mm. on 35-mm. ciné film, is small and compact, its dimensions being $4\frac{1}{2} \times 3\frac{1}{2} \times 1\frac{1}{2}$ in. over all projections, and its weight 22 oz. When closed, the lens is completely protected by a small square baseboard of metal. Pressure on a button opens the camera, the baseboard dropping while the front, which is firmly held by crossed struts, flies forward into the "infinity" position, where it is extremely rigid.

For focussing, the camera is equipped with a focussing mount, scaled to 4 ft. There is only a single eyepiece for both range-finder and view-finder, the image being seen doubled over a small bright area in the centre of the field of the view-finder until the lens is correctly focussed. The fact that accuracy of focussing can be watched and checked while observing the whole field of view is of great value in handling

the camera rapidly, and in avoiding out-of-focus shots of objects liable to change their distance from the operator. Even though the image seen in the range-finder is reduced in size, the accuracy remains more than adequate for the 5-cm. lens fitted, even at apertures as wide as $f/2$. Since the camera does not take interchangeable lenses, no more than this could be required. Closing the camera automatically resets the focussing to infinity.

The release of the Compur Rapid shutter is brought to the body of the camera, where it is very conveniently operated by the first finger of the left hand. The release is light, and allows the camera to be held firmly in both hands while firing the shutter. Even at comparatively slow speeds, camera-shake is quite easy to avoid.

On one point we thought the arrangement of controls open to mild criticism; the knob by which the focussing lever is operated is rather close to the setting-lever of the shutter, and unless the fingers are definitely removed from the focussing adjustment before the shutter is fired, they are rather liable to catch the setting lever as it flies back.

The back hinges open for loading, and the camera takes the standard 36-exposure daylight-loading cassette used by most instruments of its type. Film-advance is automatic, the take-up spool being locked when 8 perforations (one frame) have passed over the sprockets. A touch on a release-button after the exposure is made allows the film to be wound on again to the next position. Shutter and film-wind are not interlocked.

For carrying, the camera has two neat eyelets to take a neck-strap, and we found that as an alternative it could very comfortably be accommodated in a hip pocket, a method of carrying it encouraged by the protection afforded to the lens by the baseboard.

The Weltini, equipped with 5-cm. $f/2.8$ Tessar in Compur Rapid shutter, costs £25 10s., and may also be had with $f/2.8$ Xenar at £22 10s., or $f/2$ Xenon at £27. It can be obtained through all dealers, and any further information required can be had on application to the sole importers of Welta cameras, Messrs. Peeling and Van Neck Ltd., 4-6, Holborn Circus, E.C.1.

Miniature Camera Gossip

By LANCELOT VINING.

I CONTINUE to receive letters from readers who are over-developing the new Agfa F film. They ask me many questions, but rarely tell me the one vital point: are they using the curtailed development time?

R. A. P. (West Kirby) wants to know what I meant when I said that some exposures required D76 and some Meritol. If I expose a film as indicated by my Sixtus meter, or if I know that I have under-exposed, I use D76, but when I know that I must have exposed very fully, I use Meritol. If I decide before taking the photographs that I am going to develop in Meritol, I increase my meter reading one-third to get a very full exposure.

The other day I developed a film (Agfa F) in some No. 15 that had already had five films through it. The results were very pleasing, and the more I use this developer the better I like it. I wish it were easier to make up; one

PORTRAIT OF A DRAGONFLY.

Dark Doings.

I said things when I was called up to Town on Sunday evening for a dress-rehearsal of the Cotton Club Revue at the Palladium. I arrived to find that 50 per cent of the dresses were still in the Customs, so I had to wait until the next evening. Then I found out that their dancing required all of $1/2000$ th, while the lighting was all against this, so I cannot say that I had a very good evening. But there is one thing about these dark folk; with the strongest spotlight you can get a certain amount of detail in their features as well as in their dress.

Zoo Close-ups.

I spent a very interesting hour recently in the insect house at Regent's Park, using the Contameter on some of the really small crea-

THE LEADER OF THE TRAMP BAND.
Cotton Club Revue at the Palladium, $3\frac{1}{8}$ -in. lens, $1/50$ th, $f/2$. I.S.S.

ture. When the negatives are enlarged to 30 diameters, some of the results are amazing.

I exposed on the sting of a scorpion, a dragonfly and a grasshopper, with an extra exposure on the latter's saw-leg. I used the F film and developed with No. 15, and even with this great enlargement there is not the slightest sign of grain.

I have been warned to keep an eye on the fixing time of the new F film. The film is fully fixed in five or six minutes, and I am told that after this time the bath may start to devour the high-lights.

Warning.

I have been warned to keep an eye on the fixing time of the new F film. The film is fully fixed in five or six minutes, and I am told that after this time the bath may start to devour the high-lights.

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

Gaiety After Dark By J. C. GREEN.

ALL THE FUN OF THE FAIR. 1/10th at f/4.5.

THE gaiety of many seaside resorts is enhanced by a permanent or semi-permanent fair, where will be found roundabouts, electric motor-cars, coco-nut shies, houp-la stalls and sideshows innumerable. Holiday-makers in the country, even, may have the good fortune to find that their visit coincides with that of a travelling fair. Wherever met, these fairs offer plenty of material for photography, even with lenses not of "freak" aperture.

The exceptionally brilliant lighting brings subjects within the scope of a lens of aperture f/4.5 or even f/6.3, provided that a steady hold for the camera and a shutter giving slow instantaneous speeds are available, while the owner of a fast lens will find plenty of scope.

The miniature camera is here at its best, being inconspicuous and equipped with a fast lens. The user of the more modest types will find a stick provided

with a 1/4-in. Whitworth screw at the top an invaluable "steady" for the longer exposures. Super-sensitive panchromatic material and a lens hood are two essential items which complete the necessary outfit.

Exposure will always be the longest practicable instantaneous shutter speed. It is under and not over exposure which has to be guarded against. The examples shown may be taken as a guide to the

A GAME OF SKILL.
1/25th, f/3.5.

minimum permissible, and in general it may be said that for close-up shots immediately under strong lamps 1/20th second at f/3.5 is adequate, while for distant subjects 1/10th or 1/5th second is necessary at this aperture, using supersensitive panchromatic material. Do not be afraid to include naked lights; this is almost inevitable, and no undue halation effects will be experienced on modern films;

plates should be backed.

Development should be as for normal subjects, remembering that supersensitive emulsions require full development to avoid too soft a negative. Do not be disheartened if the resulting negatives are composed largely of clear celluloid, as they must necessarily be if any sky or unlit areas are included; provided that the subject itself is well in evidence all will be well.

TRADE DEPRESSION.
1/5th, f/4.5.

ROLLING PENNIES. One has been caught in motion. 1/25th, f/3.5.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

TYPES OF EXPOSURE METER.

What is the best way of finding the correct exposure? Should I use tables or a calculator, or should I be better off with an exposure meter? Having just bought an expensive miniature, I cannot run to more than about twenty-five to thirty shillings for a meter.

F. C. L. (Bournemouth.)

There is no question that an exposure meter of the type that actually measures the intensity of the light is more satisfactory than any tables or calculator can possibly hope to be. The latter are at best little more than a guide to prevent the making of any serious error.

The only two types of meter that actually measure the intensity of the light are the photo-electric meters and those depending on the darkening of a piece of sensitised paper. Meters of the former type do not fall within the price limit you mention, but you can obtain a sensitised paper meter for quite a small sum. So far as we know, the only ones of this type at present being made are the Wynne exposure meter, made by the Infalible Exposure Meter Co., Wrexham, and the Ilford Exposure Meter, made by Ilford Ltd.

FOGGED FILM.

I enclose some frames, and a tail-piece, from a length of fast panchromatic film recently developed by me. I desensitised for 1 minute, and then developed in an M.Q. borax developer for 8 minutes by a well-diffused small white light. Are the negatives fogged? And if so, could you suggest the cause?

M. H. (Walthamstow.)

The negatives you send are suffering from slight light fog, as are the two odd pieces cut from the end of the film. From the fact that this fogging extends over the margins of the pictures it quite certainly arose in the dark-room, and we should imagine that the light you used for development was too bright.

The recommended period for desensitising is from 1 to 2 minutes, and, if you had given the longer time instead of the shorter, the film might have been rendered sufficiently insensitive, and not fogged by the light you used.

We recommend you to give 2 minutes in Desensitol, and to use a considerably less brilliant light for development.

SMALL ENLARGEMENTS.

I intend to take some photographs requiring a very high speed film, but am afraid of the grain I shall get. My negatives are only 24 x 36 mm., so that grain really matters and I am very anxious it shall not show on the enlargements, which will be 3 1/2 x 2 1/2 in size.

C. A. P. (London.)

As you are only enlarging to 3 1/2 x 2 1/2 we should advise you to use the fastest film available, and disregard altogether the question of grain, which you can quite safely do in the circumstances.

HIRING A MINIATURE.

I usually use a large camera, but for holiday purposes would like to have something rather more portable. Do you know of any firm that will lend me a miniature camera on hire for a few weeks? I feel that by hiring, instead of buying, I shall have the use of a higher-grade camera than I could otherwise afford.

M. S. L. (Gloucester.)

Any of the larger dealers, we believe, will lend a second-hand camera on hire, but unless you are known to them, you will probably have to pay a deposit equal to the value of the camera. We would add a strong recommendation that you arrange to have the camera in your possession for at least a week before you go away, so that you may become sufficiently at home with it to use it with confidence. It is extremely easy to do the wrong thing at the critical moment when using an unfamiliar camera.

FROM LENS OR FILM?

I have a camera fitted with a Leitz range-finder (not coupled). The focussing adjustment is scaled to match the range-finder, and I notice that the distances are measured from the back of the camera and not from the lens. Is this not an unusual arrangement? E. L. T. (Ashton-under-Lyne.)

The Leitz range-finders measure the distance of the object from the range-finder itself, and it is evident that your camera is scaled to correspond with the readings of the range-finder when this is mounted on the back of the camera. With your particular combination of apparatus, this is the most convenient way of arranging matters. But we agree that it is more usual for the distance to be measured from the lens.

How I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXCVIII.

Mr.

A. H. ROCHE.

From information communicated to our Special Representative.

"I THINK it is true to say that the great attraction of photography for me lies in the fact that I can satisfy in one hobby two fundamental desires. First, it enables me to use the precision apparatus and technical methods that have always had a fascination for me; and secondly it offers a means for expressing, however inadequately, the emotions created by the beautiful things I find around me.

"Being an amateur, I take photographs primarily for my own amusement, and my exhibition pictures are simply a selection of the best of the photographs taken throughout the

year. I usually know beforehand what it is I wish to express, and attempt to control the technical processes to achieve this end as well as possible.

"After some experimenting I now have three cameras in use. These are a Leica Model III, a Rangefinder Bessa and a $3\frac{1}{2} \times 2\frac{1}{2}$ T.-P. reflex which is adapted for use with the normal 5-in. lens, a Dallon or Adon Telephoto lens, and an ancient Dallmeyer 2B portrait lens of $8\frac{1}{4}$ -in. focus which I consider invaluable for portrait work. I find, however, that I use the Leica for a large part of my work and, as time goes on, I tend to use it more and more. I possess both wide-angle and telephoto lenses for this camera and find that such equipment covers almost all my needs.

"Except for occasional subjects requiring special treatment I now use roll film exclusively. My preference is for Agfa Isopan F or I.S.S., depending on the speed required, and I am particularly pleased with the new 35-mm. stock recently brought out by this firm. For development I employ either D.76 or Meritol.

"I have two enlargers, one for Leica and the other for $3\frac{1}{2} \times 2\frac{1}{2}$ negatives, and the first procedure for either size is to make a half- or whole-plate enlargement. If the print looks at all suitable for exhibition purposes I then make a 15×12 or 12×10 in. enlargement of the required portion on Kodak Royal, or on chloro-bromide paper. For development I prefer amidol, but in the case of Bromesko and chloro-bromide papers I always use the developers recommended by the makers.

"Normally I do no retouching on either negative or print beyond simple spotting; but almost always I find that the final result is improved by judicious shading when enlarging, and I make the fullest use of such skill as I may possess in this direction. I sometimes use oil dope, but mostly I do not. In cases where I think considerable control is necessary, I make an enlarged paper negative, and I hope in future to use this interesting process to a greater extent.

"As regards subjects, I take anything that appeals to me, and cannot be said to have specialised in any one branch with the possible exception of portraiture. Most of my portrait work is done indoors by the aid of Photofloods, sometimes using the reflex with the $8\frac{1}{4}$ -in. lens and sometimes the Leica with the 9-cm. Elmar. My picture 'Age' was taken with this latter equipment.

"Such artistic successes as I may have had are, in a large measure, due to my father, who, after many years of water-colour painting, has given me so much sympathetic advice. I should also like to take this opportunity of expressing my appreciation of the criticisms that are always enclosed with the prints returned from 'The A.P.' competitions. In my opinion this is one of the most valuable of the many services rendered, and has been extremely helpful to me."

(A further example of Mr. Roche's work is reproduced on one of the centre Art pages.)

VANITY.

A. H. Roche.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"HOLIDAYS," by H. Garry.

THERE are two things that strike one very forcibly about this picture. The first is the fidelity of the tone values, and the second the way the figure of the child has been forced into prominence despite the presence of a nearer figure of larger scale.

In connection with the first, most of us will have recollections of our early efforts in this direction. We made our exposures quite gaily and hopefully, developed our negatives and made our prints. We might have thought they were not so bad—anything in the nature of a result would be an achievement in those days—and were quite annoyed and resentful when our subjects pointed out, perhaps a bit too bluntly, that the prints might be a good deal better if the features were not so dark and they could tell whom they were supposed to represent.

We found, in course of time, that when the light fell from a source almost anywhere behind the subject, it was practically impossible to get a rendering of the features, where they came against the sky, and, at the same time, to show any tone at all in the latter as the setting. When, however, such subjects were tried with the light falling from in front of the figure, or over one or other of our shoulders, we found a decided improvement, although, if we got the light falling frontally and directly on to our subjects, we had to deplore the way they screwed up their faces, and they, in their turn, were brutally frank about the way we had caught their expressions.

That, at least, was my experience, and while, since then, the difficulties have been appreciably lessened by the better colour sensitiveness of the modern emulsions, I got so fed up with criticism and the lack of appreciation and encouragement that I turned my attention to landscape, street scenes, and marine subjects, which could not and did not answer me back.

And so great an interest in these classes of work did I develop that, nowadays, it is only very occasionally that I make excursions into portraiture and figure work. In those days, however, I would not, nor would any of my fellow-workers, have believed it possible to have got such a tone in the sky with so faithful a rendering of the features as has been obtained in this example. With the same lighting—coming from a point in

to get the plate or film to distinguish between blue sky and sunlit faces, and, without that, most of the attraction of the picture would go. Even so, we must continue to have regard to the direction of the lighting, for the relative brightness of the two elements changes immediately it gets behind the subject.

It should fall from a source in front of and to one side of the sitter, and, either indoor or out, the most generally useful lighting will be that which falls from an angle of 45° above and to the side of the subject.

As far as the arrangement is concerned, a casual glance is enough to enable us to appreciate that the main attraction centres in the head of the child. It is obvious that its pull is greater than that of the woman, and the fact is interesting inasmuch as it demonstrates the contention, frequently advanced in these columns, that the central position is the strongest of all, although on account of the impression of formality and symmetry it creates, it is seldom possible to employ it. It is often said that the central placing inclines to weakness and that the strongest points are those which are formed by the points of intersection of divisions of vertical and horizontal thirds. The points of intersection in question are, it is true, more generally suitable for the centre of interest than the centre of

advance of the figures from the right—we might have got something like as good a measure of modulation in the faces, but, short of extensive dodging about with masks and so forth during printing, we could not have managed, with the material that was available, to obtain the same depth of tone in the sky.

That so true a rendering as this is possible to-day is a thing we owe to the very considerable improvements that have been made in the colour sensitiveness of emulsions. Without them, it would still not be possible

the print, but that a position on the centre lines is the stronger is clearly to be seen in this instance, for the head of the woman falls on the lower right of one of the points of intersection and its pull is decidedly less than the head of the child, which falls athwart the vertical centre line.

The attraction of the latter is emphasised by the fact that it is the higher in the picture space. The placing of the woman's head throws the secondary pull over to the right, and, with no equivalent on the left, symmetry is entirely countered. "MENTOR."

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page.

IN our recent special Summer Number—July 21st—the opportunity was taken of drawing attention to the beauty of effect occasioned by the influence of sunshine on white cliffs as exemplified in No. 3 of the prints reproduced on the Beginners' page. This week, we have an example of a similar effect in No. 5, "Dorset Coast," by A. J. Nasmyth, and it is no less well recorded.

Colour and Light.

The brilliance of the light on the cliffs is shown up extraordinarily well by the depth of tone in the sky and sea with which it is contrasted. The impression is very colourful and luminous, and, pleasing as the picture is, the actual scene must have been even more delightful and attractive to the eye.

I think, however, that the effect has been somewhat overdone and that the contrast is a trifle exaggerated. The light on the cliffs, particularly about an inch from the left, seems burnt out and practically devoid of any tone at all. Printing, obviously, cannot be carried any farther or else the sky and sea would be manifestly too dark. Even now, they seem to show too great a weight of tone, and, while a certain amount of artistic licence might be claimed, I scarcely feel that it would extend so far as to cover so extreme a case.

The root of the matter is that the exaggerated contrasts make the effect too brilliant to be natural, and, to get a greater appearance of truth, those contrasts must be reduced. It might have been possible, had development of the negative been curtailed by about a third, to have obtained, with the present printing paper, a rendering that would be reasonably free from this suggestion of excess; but, as the negative is finished, the necessary reduction in contrast can only be obtained by the substitution of a softer grade of printing paper.

Vigour and Brilliance.

The probability is that, when the change over to the softer paper is tried, the result will at first seem disappointing. The print, as it comes from the fixing bath, may, in the dim light, seem flat and lifeless in

comparison with the brilliance of the other at the same stage.

But, get the washing and the drying over and lay the two prints side by side. Then, there will be no question as to which is the better. What seemed to be a source of degradation in the dim light of the workroom will be found to represent detail and gradation in the softer print, assuming that it is seen in a good light, and neither sea nor sky will contrast so violently with the light on the cliffs.

The light itself will seem more luminous because of the added modulation, and the same quality will extend to the sky on account of the lighter tone in which it will be rendered, while, as a whole, the reduction of contrast will enable the print to convey a more harmonious impression.

Values in Harmony.

A feeling for tones or values in harmony needs a bit of cultivating. A print like No. 5, as it would seem when just taken from the fixing bath, would appear most captivating. The depth of tone in sea and sky in the wet print and in a weak light might seem a bit heavy, but there would be the feeling that it would be better in the full light of day, and the lack of tone in the lights would not be perceptible.

The beginner would regard the print as perfectly satisfactory; would probably continue to do so, and fail to appreciate its imperfections until some such comparison as indicated above forcibly brought the difference home to him. He would, however, gather it in time, even though it might be necessary, in the first place, to distinguish between the qualities of the first and second examples and point them out for his edification.

Harmony of tone is a very important thing, and how valuable it is can be estimated by a reference to the full page reproductions which are contained in the centre of each of our issues.

It is a feature, for instance, in the print discussed under the heading of "Pictures in the Making" this week, and in Nos. 4 and 6, "Durdle Doog," by C. A. Reader, and "Lovely Friday Street," by Miss Muriel B. Rayner, the need for an adjustment of the

printing papers is even more apparent than in No. 5.

Distinctions and Differences.

The patch of shore in the bottom left-hand corner of the former has scarcely the slightest of tones, and no adjustment of the printing depth will afford any improvement without inviting a disability—in the shape of too heavy tones—elsewhere.

With No. 6, the lighter portions, perhaps, are not so bad, but the trees on both sides are nothing but chunks of solid black. In both cases the only way to attain even an approach to a well-graded harmony of tone throughout is by the substitution of a softer grade or type of printing paper, for no other expedient is likely to provide the distinctions and differences that should exist both in the lights and darks.

No. 3, "Liquid Sunshine," by J. Massom, is a good deal better in this respect, and it and No. 2, "Dartmouth Castle," by S. L. Connars, get nearer a real harmony of tone than any of the others on the page. The latter, however, is somewhat lacking in the life and vitality that sunshine alone seems to confer, and, besides this, a greater depth of printing seems advisable.

Sunshine and Life.

It is, nevertheless, a well-arranged subject, and, under more favourable conditions, might be made into a very good thing. A slightly frontal side lighting, which might occur at another time of day, suggests itself as desirable, and, if it be possible to repeat the exposure, it might be as well to pay several visits to the spot in order to determine when it looks its best.

If it should happen that an effect similar to that in No. 5 should present itself, with the light showing up the castle against a darker sky, it would be well worth the trouble and would make a picture of which anyone might be proud.

No. 1, "The Mart," by F. J. Taylor, is a bit of a medley, and it is difficult to treat a subject which includes so many figures. Three or five at the most offer better opportunity for effective isolation, although in such work it is often very difficult to get a good selection. "MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

SUMMER ON THE RIVER.—II.

AS I promised to say something about photographing on the lower reaches of a river I made a sudden dash to get a few illustrations for the purpose, but had scarcely any better luck than on the previous trip higher up. But whatever river we make for, and whenever we go, we have to depend on such chances as offer.

The lower Thames is very well served in the summer months by boats making both long and short trips, and many other rivers have similar facilities; while boats plying from different seaside towns provide much the same chance for subjects as those in river estuaries. It is not so long ago that on all such trips there were almost certain to be chances of shots at fine sailing vessels, but to-day the best of them are gone, and we can hardly hope for more than yachts, sailing barges and perhaps fishing boats.

Still, the beginner on a ship or boat in tidal waters may safely rely on bagging a few passing craft which offer considerable variety of interesting subjects. But he is likely to be misled by distances, and is liable to shoot at vessels so far away as to come out too small in the negative for any practicable enlargement. With a little practice the

Fig. 2.

finder is a guide, and unless it shows a vessel on a reasonable scale the shot should be missed. Otherwise there is no difficulty about taking such subjects, as they require neither a large aperture nor a high shutter speed.

I could fill many pages with snaps of all sorts of vessels taken afloat, but I am suggesting other subjects instead, some of which will combine to make a pleasant memento of any such trip. These include shots at places of call, as the boat approaches or leaves them, taken respectively from bow or stern. It is not always easy to find positions for taking these subjects, and in my experience there are always a few of one's fellow passengers whom it is a great temptation to throw overboard. Probably they often think the same of me.

Fig. 1.

Fig. 3.

Fig. 4.

It is a good idea to make a general survey of the boat, and see what vantage points are available. Sometimes the best of these are on a part of the boat for which a small extra charge is made, and if so it is worth while paying up. At the same time, there are always good positions from which certain shots can be made quite comfortably, as there is plenty of elbow-room, and sometimes a chance of a bit of a splashing.

In the last few years there have appeared a good many pictures of a boat's davits and tackle, and some of them with a fine sky beyond have been very striking. I did not find such a subject that would stand comparison with these examples, but I used parts of boat tackle as accessories with passengers as in Figs. 1 and 4. The best of these I am keeping up my sleeve.

Mindful of other popular subjects I examined the bridge and the funnel, but drew a double blank—as I deserved.

I collected a few groups of passengers in various parts

Fig. 5.

of the boat, as in Figs. 2 and 3, and one or two single figures, including a dejected youth whose holiday was so obviously over that I am suppressing the result in case he should see it.

I also did quite a number of flying gulls, but some of these could not be done with a simple camera. Others could; like Fig. 5, taken against the light. Gulls often follow a boat in dozens, and they sometimes plane along, so that they can be taken at a suitable range with $1/25$ th of a second at $f/11$, or thereabouts. This provides quite good sport for the beginner, if he is patient and prepared to waste a few films; and he may get some first-rate shots.

W. L. F. W.

Photograph the Small Things

LARGE and well-known public buildings may look very imposing, but it does not follow that the photographer will find them satisfactory material for holiday snapshots. They are, for one thing, so much photographed that almost any print is likely to look hackneyed; and for another, it is extremely unlikely that an entire stranger staying only a few days could secure a better picture than that represented by the view-card of the local photographer, which was probably selected from a number of exposures made by workers familiar with the locality and its conditions.

For these reasons, it is often cheaper and more satisfactory to purchase a collection of local view-cards—and to incline one's practical efforts towards subjects that at least are not hackneyed. The plan of photographing a familiar scene as a vista seen through a pleasing framework of foliage will certainly give an unusual impression,

but this is only to drape the old view in a new frame.

Far better than all such devices is the plan of photographing the small things. The Londoner will very readily be able to perceive that a corner of the London Cenotaph will yield a more pleasing and striking picture than the whole of it. And, in any case, it can hardly be denied that a few pigeons on the broad steps of St. Paul's may make a better picture—even a better *topographical* picture—than the great edifice in its entirety from Ludgate Hill.

Nearly always the photography of small things must be conducted in such a way that local features representing the topography are not entirely destroyed; most of us have a strong sense of place markings, and we like to recognise the locality of our holiday pictures without being prompted.

The temptation to take hackneyed views and to avoid the smaller studies

is, of course, much greater when the photographer is working abroad. Perhaps there is some excuse for this, but the temptation should nevertheless be steadily resisted—for there are infinitely more good holiday cameos abroad than there are in England.

Photograph the strange station scenes, the strange locomotives, the strange river and canal boats. Even the automobiles are strangely different from those we see at home.

But make your pictures tell a story and make them *personal*. Instead of a hopelessly tame photograph of the gendarme, get father to ask him any question that will bring out his expressive gestures; and take all your photographs on these lines. Above all, avoid the usual posed photographs of porters and market-women, for it is so easy to persuade a friend to engage them in conversation and make a small purchase. The resultant bargaining should be well worth a film.

MAKING BETTER SNAPSHOTS-10

By DAVID CHARLES.

This article is the tenth of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

THERE is something peculiarly tantalising about traffic on the river. Whichever bank one is standing on it seems as though most of the passing boats must select the other side of the river for their passage. What really happens, of course, is that the camera is liable to exaggerate the extent of the open space of water immediately before it, and apparently to diminish the size of anything which is beyond a certain distance from it.

These combined facts account for the frequency of snapshots like Fig. 1. It probably looked quite fascinating to watch the steamers pass by, each one

Fig. 1. Empty water is disappointing.

Fig. 2. A foreground makes all the difference.

Fig. 3. A not-too-dull foreground.

throwing up a wake of water which made ever-changing patterns on the surface. Yet there are few subjects so disappointing, and so surprisingly devoid of interest if one cannot get reasonably near at the time of taking the photograph.

Adding a Foreground.

Now in Fig. 2 the boats are not even moving, yet the result is six times as interesting. This is partly because of the way the foreground is "framed," by the parapet and the lamp-post, and partly by reason of an element of human life. It is an interesting experiment to cover up this "frame" by means of a couple of scraps of paper. On then comparing the matter that is left with Fig. 1 it does not appear that there is very much left to choose between them in point of interest.

Foreground or Nothing.

I think the lessons to be learnt from this simple comparison will not be lost by those who read this page. When faced with what promises to be a rather empty "foreground" to their water-scapes, I think they will get in the way of looking out for some-

thing that will repair the lack. Supposing that nothing is to be found? In that case I would respectfully suggest that the shutter be not clicked. That piece of film will very soon be recording something more worthy of the very astonishing perfection which has been put into it by those who spend most of their waking hours in darkness for our benefit. But that, although it all goes to making better snapshots, is not really a story for this page.

Fig. 4. Same boat, new and more interesting foreground.

Foregrounds on the Beach.

The "empty foreground" is not only experienced on the river; one may find it on the foreshore just as often. No need to duplicate here example No. 1. The stranded fishing smack in No. 3 is not quite so badly off. It has some dark bastions and a slice of shadow to prevent it looking all alone in the space. There were a few humans in the view, but here they are so small that they become almost invisible. They are no help to the composition.

One minor point I would ask my readers to note. Although these almost invisible people could as well be totally absent, for all the use they are to the

picture, there is a stream of water in the sand above them that it would be a pity to cut away; yet the boat has a lot less space in front of it than behind. It is one of the elementary laws of composition in picture-making that the opposite should be the case.

Space to Move.

Anything that is moving or pointing in one definite direction in the picture should have at least as much space before it as behind it; more if anything. This rule applies as much to a thing which is at rest, like a stranded boat, as it does to a race-horse. Comparison with the next picture of the same boat will show that there is something in this rule, while in addition the little bunch of people, now much bolder in the foreground, give more life to the picture.

Now just to emphasise what I have said about looking out for something to fill an empty-looking foreground, I would like to put in evidence No. 5, which shows the same stranded boat as in the other two pictures, and which was taken only about five minutes later.

Fig. 5. Again the same boat, with another interesting foreground.

A Plea for POSTCARDS

By H. STUBINGTON.

POSTCARD printing is a somewhat neglected branch of amateur photography. This is strange, for the postcard offers a number of advantages; it is cheap, it can be bought in every kind of grade and surface, and when finished the prints are of a handy size. No doubt the making of exhibition prints is the ultimate aim of most workers, but it is too expensive always to be thinking in terms of 20×16 . Friends when admiring a print will often ask for a copy, and it is here that the postcard can be so useful; large prints are often an embarrassment in a small home.

According to pictorialists the most serious criticism against the postcard is its shape, but we must remember that for years they condemned square pictures as well. Yet the twin-lens reflex has done much to remove the ban on square pictures, and it may not be unreasonable to hope that the postcard will no longer continue to suffer because of its shape. On the contrary, its very shape makes it particularly useful when dealing with square negatives; the four

FOUR POSTCARDS FROM ONE NEGATIVE.

All these prints were made, by enlargement of course, from one $2\frac{1}{2}$ -in. square negative. Careful comparison will show how each is related to the others. As might be expected, any one of the four shows considerably better composition than a print from the whole negative.

pictures reproduced here will give some idea of what can be done with a few postcards and a very ordinary $2\frac{1}{2}$ -in. square negative.

It is really excellent fun hunting for these postcard pictures; the negative is projected on to the enlarging easel and searched with a number of pieces of card, each having an opening cut in it of postcard proportions, but of different sizes. When a picture is found it is an easy matter to make the necessary adjustments for size and focus.

Although the poor artistic and technical quality of the cheaper commercial postcards may have given them a bad name, any skilled amateur who prizes good technique and has an appreciation of artistic principles can produce postcards that may without hesitation be admitted as works of art and beauty. Why not try a packet or two and see what you can do in this way?

SPECIAL CORONATION COMPETITION

AS previously mentioned, the entries in this competition far exceeded our expectations, and enormous numbers of prints were sent in from all parts of the country. Every phase of the Coronation celebrations appears to have been depicted, and we congratulate our readers on the many novel points of view they succeeded in obtaining. The technical quality of the prints as a whole was very high.

The awards are as follows:—

First Prize.—A. R. Turpin, 51, Colindeep Lane, N.W.9.

Second Prize.—J. J. Cameron, Lochiel, Hallam Gardens, Hatch End, Middlesex.

Third Prize.—J. Brindle, 5, Burnaby Crescent, Chiswick, W.4.

Four Consolation Prizes.—E. F. Munt, 30, Martindale, East Sheen, S.W.14;

Miss M. J. Habgood, 7, Chasewater Avenue, Copnor, Portsmouth, Hants; L. Matthews, 94, Montreal Avenue, Horfield, Bristol, 7; S. Allen, 199, Albert Road Southsea, Hants.

The following were also particularly worthy of special mention: B. R. Billimoria (London, W.4); T. F. Hughes (Rugby); C. W. Henderson (Edinburgh); J. Oakfield (Wembley); S. G. Lines (New Barnet); E. G. Turner (Kingston); C. M. Barlow (Coventry); D. G. Sheldon (Hull); A. Clarke (Lechfield); C. J. Henderson (London, N.W.2); Miss M. McRae (Coatbridge); M. D. Wright (Wembley Park); H. D. Cole (Ilford); S. Soulsby (Blyth); C. E. B. Isherwood (Canonbury, N.5); D. A. Ogden (Maidenhead); E. N. M. Wroughton (Hove, 4); H. A. Oakley (Streatham); Reg. Moore (Barkingside); K. N. Inman (London, W.2); I. D. Crozier (London, N.W. 11); G. F. Eales (Plymouth); H. T. Colmer (Streatham Hill).

August 11th, 1937

The Candid

THERE is no individual kind of camera which can be called a candid one. The adjective arises simply from the fact that when the results one obtains are most successful they show the subjects—generally at close quarters—in characteristic but not necessarily flattering mood or activity. Of course, any camera which possesses both speed and depth of focus not only makes “stalking” easier and more certain of success, but it allows of good hunting in conditions which would be prohibitive to any other apparatus, and that is why the miniature is the camera most in favour.

Easy Subjects.

One circumstance which is always in favour of the candid-camera photographer is that those people whose faces show the most “character,” and are therefore likely to make the best pictures, are usually also more forcefully engrossed in whatever their occupation happens to be at the “candid” moment, and their attention is the less likely to be distracted by the presence of the camera. Many a photographer has gained great credit for the naturalness of a character study, which could never have been obtained had not the person portrayed been so engrossed with his occupation that he was blind to all else.

Seizing Opportunities.

That is not to discredit the photographer, who was quick to see, and to seize, the opportunity; rather is it intended as a hint for use, to explain that, after all, there is no such thing as a “candid camera,” but that there is such a thing as good hunting. The good hunter cannot create his opportunities beyond making himself acquainted with possible venues for them, but he can very definitely make himself able and ready to see and seize them quickly when they do occur. In fact, the secret of success in candid-camera work lies mainly in that last remark.

But chance, after all, does take a very great part in presenting subjects. Not only chance, but coincidence resulted in the picture of the roundabout. I cannot claim the slightest credit (although I need not have proclaimed

Above. Good light and a stationary subject make this an easy shot.
Centre. Obtained largely by chance.
Below. The intentness of the players helped here.

Camera

By G. K. SEAGER.

the fact!) for the striking portrait of the girl at the fair. I was trying to get a good picture of the roundabout, and my shutter was timed at 1/300th for the purpose. Aiming upwards at the rapidly travelling subject, I failed to observe that people were striding into my view. So, while I was quite pleased to find this result, which is at least as good as though I had set out to secure it, the credit is due to mere chance.

Focussing Difficulties.

The main difficulty of candid photographs, as compared with photographs of people under other circumstances, lies in the focussing. It arises because the subject has to be taken in whatever surroundings he happens to be in, irrespective of whether the light is bright or dull, or whether the background is suitable or not. A poor light inevitably means that the lens must be opened to somewhere near its widest aperture, especially as the subject is not assisting the photographer by keeping reasonably still, so that in general a fast shutter-speed is needed.

With the lens wide open, focussing becomes more or less critical, even a small movement of the subject towards or away from the camera sufficing to throw him to some extent out of focus. Add to this that in order to get him unawares it is often necessary to take the photograph very quickly, with the absolute minimum of “fussing” with the camera, and it will be seen that candid photography always involves an element of chance.

A Useful Hint.

The focussing difficulty can to a large extent be got over by setting the scale to, say, 12 ft., and moving towards or away from the subject so as to get him at the right distance at the right moment. Movement of the photographer in most cases, is far less noticeable than fiddling with a camera—of which the most attention-attracting form of all is to hold the camera up to the eye to use a range-finder.

With these few points in mind, even a beginner at this type of work may very reasonably expect to find a good proportion of successes among his results.

Amateur Cinematography

NEWS, NOTES AND MATTERS OF INTEREST FOR ALL CINEMATOGRAPHERS USING AMATEUR CINÉ APPARATUS.

Sea Cruising with the Ciné Camera

By "CINÉCAM."

THOSE amateur cinematographers who have experienced the good fortune of spending a holiday on board a ship bound on a sea cruise, will immediately agree with me that this form of holiday possesses unique opportunities for delightful ciné-film making.

From this point of view the cruising holiday possesses amenities which are capable of providing enough material not for one film only, but for several. There is, in addition, the tremendous advantage of never needing to hurry over anything.

Decide on the Theme.

If the intention is to make a ciné film of the complete cruise, the general form of the completed film may be visualised beforehand. This applies to the main theme the film is to follow. The actual incidents that will go to form the "body" of the production cannot be decided upon until the actual embarkation on the cruise. The treatment of the theme will be found not to be a really difficult matter, since the various activities both on board and on shore will present an endless flow of ideas.

But it must be stressed that a strong sense of continuity must be preserved throughout all stages of the production.

When preparing to take later shots some assistance in keeping the continuity intact may be obtained from notes of previous shooting. This note-taking will remind one if each complete sequence is capable of being dovetailed into the one preceding it. After all, each separate sequence is merely a part of the whole, but it must still be complete in itself.

Watch the Viewpoint.

Before actually shooting a scene, pause a few moments to consider if there is another more interesting angle of view for the same subject.

When we first conceive a subject we generally see it conventionally. A second and more concentrated look will often suggest something more interesting about it, some seemingly latent interest unnoticed at our first cursory glance.

In order to concentrate interest, try to keep the background as simple as possible. This may appear to be a difficult matter owing to the maze of ship's equipment that litters the decks. Like many others, this difficulty is in reality not so formidable as it appears to be at first sight. If a careful search is made, a viewpoint free from distracting objects can almost always be found.

And this viewpoint should be the one to be used. As a last resort, the sky can be requisitioned, and this calls for a filter before the lens. By using an appropriate filter, light-coloured objects will be rendered strongly against a darker background.

Filters and Stops.

Speaking of filters, it is much better to shun guesswork when choosing a suitable one, and to employ a photographic vision filter. This gadget will make quite certain that a filter of the correct depth is chosen.

A mistake often made, with disastrous consequences, is that of falling victim to the pseudo-actinic value of the light in some foreign latitudes. The seemingly greater strength of the light when compared with that in our own country leads us to stop down our lenses too far when shooting, and eventually to raise our voices when processing our negative stock. The moral is to employ a reliable type of electric exposure meter.

It must not be forgotten that a "cruise" also includes visits to places

ashore. When on shore expeditions the majority of the shots taken will be in the nature of records. Even so, it may still be possible to preserve the continuity. To suggest the illusion of motion some form of movement must be included. It may be supplied even by so small a thing as a bird hovering above, or easier still, pedestrians moving in the foreground. In this way objects such as buildings lose much of their lifelessness.

Cheerfulness the Keynote.

Bear well in mind that a cruising holiday is essentially a period of fun and hectic gaiety, and so avoid including anything suggestive of sombreness.

In some of the places visited inland, conditions of abject poverty and squalor may be encountered, especially in the back streets and less frequented alleys. Also human beings in unpleasant physical conditions may be seen. There may be no harm in shooting these subjects for purely record purposes, but they should be considered definitely taboo for inclusion in the completed film of the cruise.

Action is the very essence of most holiday pleasures, and surf-board riding behind a motor-boat is no exception. Good as a "still" subject, it would be even better brought to life on the ciné screen.

Hold the Film's Interest

By
T. F. LANGLANDS.

THE other day we were inspecting a film which depicted a sea trip in a sailing vessel; there were some fine scenes of a boat away out at sea, near shots of another boat, and others taken on board showed close-up details of such items as the wheel, the chart which lay spread open alongside, and the timbers and rigging of the boat.

When shown in its original order as actually taken by the camera, it seemed to be a jumble of close-up shots and then rather lengthy distant scenes, with one particularly fine shot of the distant vessel framed in the rigging of the following one.

There was obviously plenty of interesting matter of good photographic quality, and not a single spoilt frame anywhere, but as a film it lacked sustained interest; in a word, it was aimless.

Now this is a case where judicious editing can set things right so that the film will hold one's interest throughout.

There is no need to think out an intricate plot; we can follow the lead of some professional productions which scorn all effort to tell a woven tale; all that is necessary is to keep the observer aware that we are on one vessel, and following the other. This entails the frequent alternation of the near shots with the long-distance scenes. First, we cut out about half of all the long-distance shots depicting the distant boat, as the footage on these was over-ample anyway; then all that has to be done is to arrange that the order in which the shots are presented will show an ever-decreasing distance between the two boats; the close-up detail shots have to be fitted in between the long-distance

ones, so that our interest is continually taken from one plane to the other; so for the trouble of making a dozen or so splices, the resulting film is made to hold our attention from beginning to end.

It is not always realised that the human eye has a distinct advantage over the camera in the flexibility of its view. It will pick out salient features while keeping a general impression of less conspicuous details, the mind co-operating with the eye so closely that few people are aware how restricted is the area of their critical sight. The film, however, has a less mobile and more restricted view, and therefore the insertion of abundant close-up shots, when skilfully blended into the picture, provides one of the most satisfying methods of keeping hold of realism in our films.

The Week's Meetings

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Wednesday, August 11th.

Partick C.C. Print Criticism.

Thursday, August 12th.

Hackney P.S. Outing to Wanstead Park.
Hampshire House P.S. Gadgets.
North Middlesex P.S. Evening by the Technical Committee.
Oldham P.S. Portraiture.
Stretford C.C. Portrait Evening.

Friday, August 13th.

Folkstone C.C. "Lenses." A. J. Stewart.

Saturday, August 14th.

Bournemouth C.C. Afternoon Outing to Wimborne and District.
Bristol P.S. Compton Martin.
City of L. & Cripplegate P.S. Epping Forest. Mr. Snell.
Exeter C.C. Broad Hembury. Mr. Newlands.
Hanley P.S. Chapel Chorlton. Mr. Watkins.
Ilford P.S. Ambersbury Banks. Mr. Roughton.
Kinning Park Co-op. C.C. Culross.
Leicester and Leicestershire P.S. Outing to Ratby Burroughs & Thornton.
Manchester A.P.S. "Sweetenham." J. E. Sykes.
Sheffield P.S. Barlow Well-Dressing. Miss M. D. Turner.
Singer C.C. Levensgrove Park, Dumbarton. A. Brownlie.

Saturday, August 14th (contd.).

Southampton C.C. Outing to Cadnam. R. T. Bruton.
Windlesham C.C. Thames Motor Launch Trip.
Worthing C.C. Outing to Arundel.

Sunday, August 15th.

Hampshire House P.S. Hindhead. W. F. Moore.
Manchester A.P.S. "Dovedale." W. Stephenson.
Scarborough A.P. and Ciné C. Egton Bridge, joint Outing with York Society
Windlesham C.C. Bramhill Park Outing.
Woolwich P.S. Horsendon Hill and Harrow. Mr. Nunn.
York P.S. Egton Bridge.

Monday, August 16th.

Oldham Equitable P.S. "Gems of English Architecture." T. Burton.
Southampton C.C. Informal.

Tuesday, August 17th.

Hackney P.S. Colour Photography.
Manchester A.P.S. L. & C.P.U. Travelling Exhibition.
Oldham P.S. Council Meeting.

Wednesday, August 18th.

North-West London C.C. A Tour of the City of London.

Exhibitions and Competitions

CURRENT AND
FUTURE.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, August 31. Rules in the issue of July 28.

The Amateur Photographer Novices' Competition.—Special prizes of supplies of films. Latest date for entries, September 30. Particulars in this issue.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of *The Amateur Photographer*. Full particulars in advertisement page in this issue.

Nuro Competition.—Cash prizes every month. Special prizes for boys and girls under sixteen. Full particulars obtainable from any photographic dealer, or from Nuro Ltd., Biggleswade, Bedfordshire.

Isle of Man Sixth Annual Amateur Photographic Competition, £300 cash prizes. Open until September 30. (P. A. Clague, Publicity Department, Isle of Man.)

"Daily Mirror" "Nushots" Weekly Photographic Competition. Cash prizes. (The Editor, "Daily Mirror," Fetter Lane, London, E.C.4.)

XVIIe Salon International de Photographie de Belgique.—Open, May-October. (M. Julien Lejeune, 70, Av. Van Becelaere, Boitsfort, Brussels.)

Northern Photographic International and Open Exhibition, 1937.—Open, June 19-August 21. (W. Whitehead, 8, Bullrold Drive, Bradford.)

Eighth Chicago International Salon of Photography.—Open, July 15-September 19. (Alex. J. Krupy, Chicago Camera Club, 137, North Wabash Avenue, Chicago, Illinois, U.S.A.)

XXXIIe Salon International d'Art Photographique de Paris.—Open, October 2-17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris (9e).)

I International Exhibition of The Photo-Press and

Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova 11, Zagreb, Jugoslavia.)

Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Open, September 11-October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)

46th Toronto Salon of Photography.—Open, August 27-September 11. (W. H. Hammond, 2, Gould Street, Toronto, Canada.)

3e Internationale Focus Fotosalon, Amsterdam, Holland.—Open, September 11-26. (Focus, Ltd., Fotosalon, Bloemendaal, Holland.)

Second Western Ontario Salon of Photography.—Entries, August 25; open, September 13-18. (A. E. Adams, 923, Maitland Street, London, Canada.)

London Salon of Photography.—Entries, September 1; open, September 11-October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

First International Competition of Artistic Photographic Pictures, 1937.—Entries, September 1, 1937. ("Camera," Messrs. C. J. Bucher, Ltd. (Publishers), Zurichstrasse, 3/5, Lucerne, Switzerland.)

Fifth Annual Salon, Rockville Centre, N.Y.—Entries, September 1; open, September 11-18. (Dr. M. F. Lee, 74, N. Long Beach Road, Rockville Centre, N.Y.)

Anthracite Salon of Photography, Everhart Museum, Scranton, Penna, U.S.A.—Entries, September 7; open, September 18-October 4. (Salon Director, Everhart Museum, Scranton, Penna, U.S.A.)

The Victorian International Salon.—Entries, September 7; open, October 18-30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Entries September 20; open, October. (Modern

Magyar Fényképezők, VIII, Rákóczi-ut 19, Budapest, Hungary.)

Windlesham Camera Club.—Open, October 21-23. Last day for entries, October 2. (J. C. Hayward, Hallgrove, Bagshot, Surrey.)

Fourth Canadian International Salon of Photographic Art.—Entries, before September 10; open, October 23-November 15. (Exhibition Secretary, Canadian International Salon of Photographic Art, The National Gallery of Canada, Ottawa Canada.)

Sixth Irish Salon of Photography.—Entries, September 25; open, October 30-November 6. (The Hon. Secretary, 18, Morehampton Road, Dublin.)

"Irish Travel" Photographic Competition, 1937. Cash prizes.—Entries, September 30. (The General Manager (Photo Competition), Irish Tourist Association, 14, Upper O'Connell Street, Dublin, I.F.S.)

Lincoln C.C. Eleventh Annual Open Exhibition.—Entries, October 1; open, October 29-November 26. (Miss E. Redfern, 8, Cecil Street, Lincoln.)

International Salon Oval Table Society, Inc.—Entries, October 23; open, November 16-30. (Oval Table Society, Inc., 10, W. 23rd Street, New York.)

1st Rhode Island National Salon of Photography.—Entries, November 1; open, November 15-30. (J. Clement Grimes, 103, Westminster Street, Providence, Rhode Island, U.S.A.)

International Photographic Exhibition in Debrecen, (Hungary).—Entries, November 20; open, January, (Aszmann Ferenc, Ferenc József ut 27, Debrecen, Hungary.)

Second Indian International Salon of Photographic Art.—Entries, January 15; open, March, 1938. (N. B. Cooper, Hon. Sec., Camera Pictorialists of Bombay, 53, Nicol Road., Ballard Estate, Bombay, India.)

NEWS AND REVIEWS

ITEMS OF GENERAL INTEREST FROM ALL QUARTERS.

There has recently appeared a new edition—the fourth—of that deservedly popular shilling handbook, "Perfect Negatives," by Dr. Glover, which is No. 1 of the series of N.P. Handbooks. In the new edition the scope has been extended to cover the modern technique involved in making miniature negatives, so that the little book, already very comprehensive, detailed, and informative, may now in addition be regarded as completely up-to-date. It, and its companion volumes, are sold at 1s. each, and may be obtained at 1s. 2d. post free direct from the publishers, The Fountain Press, 19, Cursitor Street, E.C.4.

The new 8-mm. camera just announced by the Bell & Howell Company, 1801, Larchmont Avenue, Chicago, Ill., U.S.A., is literally "palm size" and is known as the Filmo Streamline 8. A new exposure guide is built into the camera, the choice of two speeds is available, and the lens is a Taylor-Hobson 12½-mm. f/2.5, fully corrected for both black-and-white and natural colour film, which is instantly interchangeable with an almost unlimited selection of other lenses. The camera is equipped with two viewfinder masks outlining the exact fields encompassed by these lenses. In addition an inexpensive adapter makes possible the use of this camera with any lens supplied for the Filmo 70 line of instruments.

Stolen.—The following cameras have been stolen from the premises of Messrs. Rudy Starita, of 157, Wardour Street, W.1. Super Nettel No. B22855, fitted with f/2.8 Tessar lens No. 1578902. Ikoflex No. B16432, fitted with f/3.5 Triotar lens No. 1711611. Super Ikonta No. B25657, fitted with f/3.5 Tessar lens No. 1825175. Leica IIIa No. 233240, fitted with f/2 Summar lens No. 353392. Any person into whose hands these cameras may come, or to whom they are offered for sale, should communicate with the police, and with the owners of the cameras at the above address.

"Night Photography with the Miniature Camera" is the title of a recently-published book by Kip Ross, the well-known American press photographer. Although the illustrations are naturally of American scenes, the book contains much information and many suggestions that will be of interest to British photographers who wish to try their hand at similar subjects.

Besides dealing with the many suitable subjects for night photography, chapters are devoted to the choice of apparatus and of films, to the exposures necessary in different circumstances, and to the development and enlarging of the film. The book is sold in this country at 4s. (4s. 2d. post free) and may be obtained from Messrs. Sands Hunter & Co., of 37, Bedford Street, Strand, W.C.2.

The Third Annual Exhibition of the Windlesham Camera Club will be held on October 21st, 22nd and 23rd, 1937, at St. Anne's Hall, Bagshot, Surrey. The exhibition, which will be opened by the Hon. Anthony Asquith at 5 p.m. on Thursday, October 21st, has seven classes, four open, and three for members only. The last day for receiving entries is Saturday, October 2nd. Entry forms and full particulars are obtainable from the Hon. Secretary, Windlesham Camera Club, Hallgrove, Bagshot, Surrey.

We understand that "The Illustrated Weekly of India" will shortly be opening a camera section in its pages. Reading matter submitted for consideration to this publication should be illustrated with clear black-and-white unmounted photographs, suitable for photogravure printing. While text and illustrations should, as far as possible, have a bearing on photographic work in India and the East, the Editor will also be pleased to receive good contributions of a general character. Photographs with a pictorial appeal are also wanted, and in every case where a picture is sent—alone or with an article—it should be accompanied by technical data regarding lens aperture, exposure, camera, plate or film used, etc. The minimum size of prints required is about half-plate, and

articles should be from 400 to 600 words and no more. All material accepted and published will be paid for. Mr. R. Ramaswami of Bombay is in charge of the Camera Section. The address is "The Illustrated Weekly of India," Bombay.

"Profitable Photography," a guide for the amateur who wishes to enter the commercial market, has now reached its second edition. It deals interestingly, and without unnecessary detail, with the type of photograph required for various purposes, with the processing of the negative, and the making and working up of the print. There is a very full list, with addresses, of the various markets in which an amateur may hope to sell his photographs. This book, which is by William Stewart, is published at 2s. 6d. net by Sir Isaac Pitman & Sons Ltd., and can be obtained through any bookseller.

We are asked by the Service Co., Ltd., of 289, High Holborn, W.C.1, to state that an error in the price of the "Robot" camera was made in their advertisement in our issue of the 21st July. The correct price should be £26 10s., the 24 monthly payments being 23s. 9d. per month.

Mr. Arthur G. Dell, 88, Casewick Road, West Norwood, S.E.27, has been awarded the 21s. prize for the best print in the latest Wallace Heaton "Babies" Competition. These weekly competitions for readers of "The A.P." are announced regularly in our advertisement columns.

FACTS and FORMULÆ

ONE or more items of practical value to the amateur photographer are given under this heading in every issue. The series from No. 1 to 61 included all standard chemical and optical formulæ and practical instructions, etc., for the principal processes. The present series (starting with No. 62) will include all the formulæ issued by the leading manufacturers of plates, films and papers.

These facts and formulæ are intended to be cut out and pasted on the thin cards of the standard size, 5 × 3, supplied for card index cabinets.

The collection, when completed, will form a concise guide to photographic practice that every regular worker will value for reference, and for that reason no copies should be missed.

"A.P." filing cabinets have been specially prepared for this card index and are now ready. The size of the box is 5½ × 3½ × 3 and each is supplied complete with a set of alphabetical index cards and 150 cards for pasting on the "Facts and Formulæ." They are obtainable from our publishers, Messrs. Iliffe & Sons Ltd., Dorset House, Stamford Street, London, S.E.1. Price 2s. 6d. post free.

87. Makers' Formulæ : Developers for Criterion Papers—(3)

Developers for Vandyck Warm-Tone Paper.

No. 1.

Metol	15 grs. (1.75 grm.)
Hydroquinone	60 grs. (7 grm.)
Sodium sulphite (anhydrous)	240 grs. (25 grm.)
Sodium carbonate (anhydrous)	178 grs. (18.5 grm.)
Potassium bromide	60 grs. (1.75 grm.)
Water to	20 oz. (1,000 c.c.)

If crystallised sulphite or carbonate is used, take 480 grs. (50 grm.) in place of the amounts shown.

For use, dilute above stock solution with its own bulk of water. For best results this developer should be used at 68° Fahr., and exposure should be so adjusted that development is complete in 1½ mins. at this temperature.

No. 2.

Metol	20 grs. (2.25 grm.)
Hydroquinone	80 grs. (9 grm.)
Sodium sulphite (anhydrous)	270 grs. (30.5 grm.)
Sodium carbonate (anhydrous)	310 grs. (35.25 grm.)
Potassium bromide	480 grs. (53 grm.)
Water up to	20 oz. (1,000 c.c.)

If crystallised sulphite is used, take 540 grs. (61 grm.). If crystallised carbonate is used, take 840 grs. (95 grm.).

For use, dilute with double its own bulk of water. This developer gives warmer tones than formula No. 1.

For best results this developer should be used at 68° Fahr., and the exposure should be so adjusted that the print reaches the correct depth after being developed for 2 to 2½ mins. at this temperature.

3½×2½ REFLEX CAMERAS

WITH the publication on these two pages of a brief description of 3½×2½ reflex cameras, and a list including the prices of each with the various alternative lenses listed by the makers, we approach the conclusion of a rather ambitious scheme. We set ourselves to do no less than to present to our readers a complete list of all cameras and enlargers for pictures of sizes up to and including 3½×2½ inches, together with a brief description setting forth the salient points of each.

The list began in our Miniature Camera Number of March 10th last, in which we published nearly nine closely-printed pages dealing with cameras taking pictures of all "miniature" sizes—that is, of dimensions not over 6×6 cm. (2½ inches square). Although the list included every camera on the British market at the time, cameras introduced since March naturally did not appear in it. These, however, have been or will be reviewed in the weekly feature "Modern Miniature Cameras."

Our Novices' Number of June 2nd continued the list with box cameras of all sizes, and in our Summer Number of July 21st, folding roll-film cameras of size 3½×2½ inches were listed. Folding plate cameras in the 3½×2½ size, described in our issue of July 28th, left no type of camera unrepresented save the reflexes listed below.

In the Miniature Camera Number we included enlargers for miniature negatives; enlargers for 3½×2½ negatives have yet to come, and we propose to round off the whole with a description and price-list of these in the early autumn, which is the season at which the purchase of an enlarger is most usually contemplated.

The descriptions of reflex cameras given below follow the same lines as the previous reviews, each notice containing, in abbreviated language, the most essential facts about the camera. Entries are arranged in order of increasing price, the cost of the camera with the least expensive lens fitted being taken as "the price" for this purpose. Each entry concludes with the name of maker or importer; for their addresses readers are asked to turn to the advertisement pages.

K.W. REFLEX BOX.—Horizontal box-form reflex camera for roll films, fitted f/6.3 or f/4.5 anastigmat lens in focussing mount. Spring-raised surface-silvered mirror acting in conjunction with metal slit shutter, speeded 1/25th, 1/50th, and 1/100th sec. Dimensions 4½×3½×4½ in., weight 32 oz. Price from £3 13s. 6d.

Sands Hunter Ltd.

RUBY HORIZONTAL REFLEX.—Horizontal single-lens reflex for plates and film packs. Self-erecting leather hood, manually-operated mirror with control allowing camera to be used upside down. Rack and pinion focussing. Self-capping focal-plane shutter

speeded 1/10th to 1/1,000th sec. Fitted 4½-in. interchangeable lens. Dimensions of camera body 5½×4½×4½ in.; weight, 40 oz. without lens. Prices, with lens, from £9 5s.

Thornton-Pickard Mfg. Co., Ltd.

ENSIGN REFLEX.—Box-form reflex camera for plates and film packs, with focal-plane shutter speeded 1/15th to 1/1,000th sec. Revolving back, light-

proof during rotation. Focussing by rack and pinion. Interchangeable anastigmat lenses, focal length from 5 in.

upwards. Self-erecting reversible hood. Manually-operated mirror. Dimensions, 6½×6½×6½ in.; weight, 58 oz. Prices from £12, including three plate-holders.

Ensign, Ltd.

JUNIOR SPECIAL RUBY REFLEX.—Single-lens box-form reflex for plates and film packs. Has long extension by rack and pinion. Manually-operated mirror with catch enabling camera to be used in any position. Self-capping

focal-plane shutter, with Auto-stop giving exposures of 1/10th to 1/1,000th sec. Self locking revolving back. Dimensions of body, 6½×5½×5½ in.; weight, 60 oz. without lens. Price, with lens, from £12.

Thornton-Pickard Mfg. Co., Ltd.

RUBYETTE REFLEX Model I.—Single-lens reflex for upright pictures on plates or film packs. Self-erecting metal focussing hood. Manually-operated mirror with control to allow camera

to be used inverted. Self-capping focal-plane shutter. speeded 1/10th to 1/1,000th sec. Will take any one of selection of 10.5-cm. lenses. Dimensions of camera body, 6½×4½×3½ in.; weight, 48 oz. Price, with lens, from £13 2s. 6d.

Thornton-Pickard Mfg. Co., Ltd.

RUBYETTE REFLEX Model 2.—Single-lens reflex for plates and film packs. Specification identical with that of Rubyette Model 1, except that

a revolving back is fitted. Dimensions of camera body, 6½×4½×4 in.; weight, 52 oz. Prices, with lens, from £14 10s.

Thornton-Pickard Mfg. Co., Ltd.

SPECIAL RUBY REFLEX.—Single-lens long-extension reflex for plates and film packs. Specification very similar to that of Junior Special Ruby, but lenses are mounted in sunk lens-box. Shutter improved to allow speeds

to be set after winding. 5-in. lens fitted as standard. Dimensions of camera body, 6½×6½×5½ in.; weight, 64 oz. without lens. Prices, with lens, from £15 15s.

Thornton-Pickard Mfg. Co., Ltd.

RUBY DE LUXE REFLEX.—Single-lens box-form reflex, for plates and film packs. Specification similar to Special Ruby Reflex, but has double swing front and rising and falling front controlled by rack and pinion. Two inches focussing movement. Dimensions of

camera body, 7×5½×5 in.; weight

64 oz. without lens. Prices, with lens, from £21 5s.

Thornton-Pickard Mfg. Co., Ltd.

SOHO REFLEX.—Single-lens box-form reflex for plates or film packs. Has long extension controlled by rack and pinion. Spring-raised mirror, forming behind it dark chamber permitting the non-self-capping shutter to be wound without fogging the plate. Mirror has ducking movement to avoid back of lens and to prevent jarring of camera.

Lens mounted in sunk box. Revolving back, with mask for top focussing screen. Shutter speeded 1/18th to 1/800th sec. Dimensions, 6½×5½×5½ in.; weight, 76 oz. without lens. Price, with lens, from £29.

Soho Ltd.

N. & G. FOLDING REFLEX.—Folding reflex camera for plates and film packs. Pull-out front supported on lazy-longs. Lens completely covered by baseboard when closed. Interchangeable lenses, normal focal length about 5½ in. Self-capping focal-plane shutter, speeded 1/10th to 1/800th sec. Spring-raised mirror. Standard model has f/4.5 lens and rising and falling swing front. Special model has f/3.5

or f/2.9 lens, rising front only. Dimensions, Standard model, $6\frac{1}{2} \times 5\frac{1}{2} \times 3\frac{1}{2}$ in.; weight, 60 oz. The Special model is

one inch thicker, and weighs 72 oz. Prices from £47.
Newman & Guardia, Ltd.

DUPLEX DOUBLE EXTENSION REFLEX.—Box-form reflex camera, for plates and film packs, with long extension up to 10½ in. Focussing by one rack and pinion covering entire extension. Front supported by double baseboard and lazy-tongs. Shutter and

mirror as Ruby de Luxe Reflex. Dimensions of camera body, $7 \times 6\frac{1}{2} \times 5$ in.; weight, 76 oz. without lens. Prices, with lens, from £27 5s.
Thornton-Pickard Mfg. Co., Ltd.

MINEX MODEL A.—Box-form reflex camera, with long extension. Revolving back mechanically coupled with mask on top focussing screen. Spring-raised

mirror set by action of winding shutter. Self-capping focal-plane shutter has speeds 1/1,000th to 3 secs., and speeds can be set before or after winding. Magnifiers fitted in hood. Spare dark slides carried in chamber in camera.

Four-way swing front can be fitted if desired. Range of extension 4 to 10 in. Any suitable lens can be fitted. Dimensions, $6\frac{1}{2} \times 6\frac{1}{2} \times 5$ in.; weight, 88 oz. Price, without lens, £50. Tropical model of brass-bound teak, £20 extra.
Adams & Co. Ltd.

FOLDING MINEX.—Folding reflex camera extending from 5 to 11½ in. by rack and pinion. Specification similar to that of Minex Model A, except that automatic masking device is not fitted.

Dimensions, $7 \times 6\frac{1}{2} \times 4\frac{1}{2}$ in.; weight, 80 oz. Price, without lens, £60. Tropical model in brass-bound teak, £20 extra.
Adams & Co. Ltd.

Readers' Questions ANSWERED

GENERAL.—All communications for the Editor should be addressed: "The Editor, *The Amateur Photographer and Cinematographer*, Dorset House, Stamford Street, London, S.E.1," and in every case, without exception, must give the name and address of the writer.

CONTRIBUTIONS.—The Editor is glad to consider original, up-to-date manuscripts on photographic subjects. All contributions must be typewritten, or in very legible handwriting on one side of the paper only. Letters or communications arising out of matters already appearing in the paper are not paid for. The Editor disclaims legal responsibility for the safety of matter submitted to him, but he will endeavour to return rejected manuscripts, etc., when a stamped addressed envelope is enclosed. MSS. or prints that are not actually accompanied by a stamped wrapper or envelope can in no case be returned. Reproduction fees for prints are only paid by arrangement beforehand. The sending of a print, without any condition stated, will be taken as permission to reproduce it without fee.

ENQUIRIES AND CRITICISM.—Advice, Criticism and Information are freely given, but the following conditions should be read carefully before applying, as any communication which does not comply with the rules must be ignored.

(1) See "General" above. (2) Every question and every print for criticism must be sent separately through the post, and must be accompanied by a *separate* stamped addressed envelope. No exception can be made in any case to this rule, except so far as enquiries or prints from Overseas are concerned. (3) Neither enquiries nor prints for criticism must be enclosed with competition prints. (4) On the back of each print sent for criticism, in addition to the name and address of the sender, must be the title (if any), and the criticism coupon from the current issue. (5) Enquiries should be clearly written, on one side of the paper only, and should be specific and not general. Such enquiries as "How can I take interiors?" or "Can you give me some hints on outdoor portraiture?" are too general to be dealt with in this section. (6) All envelopes should be distinctly marked "Query" or "Criticism," as the case may be. (7) Prints are sent for advice or criticism on the distinct understanding that by so doing permission is given for their reproduction without fee. We endeavour to deal promptly with enquiries, but cannot undertake to answer by return of post, nor can we give precedence to any enquiry.

A selection of those replies is printed each week, but all questions are answered by post. Enquiries from abroad must contain a coupon also, but it need not be from the current number, and should be cut from the latest issue to reach the enquirer.

Glazing Prints.

I have never yet glazed a print, but am anxious to do so. I know that glossy paper is used, and that it is squeegeed on to a ferrotype plate, but I am anxious to know what precautions should be taken to prevent the prints sticking permanently to the plate. B. C. F. (Berkshire.)

Provided the ferrotype plates are clean and the prints are left on them long enough to become absolutely dry, they should almost drop off of their own accord. It is an additional safeguard, before squeegeeing the prints on to the plates, to give them two or three minutes in a 10 per cent solution of formalin, and transfer them straight from this to the plates.

Speed of 9.5-mm. Films.

Into what speed categories (for use with "The A.P." Exposure Tables or Guide) should I put Pathé R.O.F. and Pathé P.S.P. 9.5-mm. ciné films? P. D. (Edinburgh.)

We suggest that you put the R.O.F. Pathé film in the "Rapid," and the P.S.P. film in the "Extra Rapid" categories. In the case of the first-named film the classification may be a shade on the optimistic side.

Stopping Down Enlarger Lens.

I understand that when enlarging f/8 does not always require double the exposure of f/5.6. Could you give me a formula from which I can work out what extra exposure is needed on stopping down? R. H. G. (London.)

The reason that in a condenser enlarger f/8 does not always require double the exposure of f/5.6 is that the condenser projects a beam of light which may be stronger in the middle of the lens than towards the outside. Since this depends on the exact setting of the lamp with respect to the condenser it is not possible to give any formula relating the exposures required for different stops. In a diffuser enlarger relative exposures depend upon the stop in exactly the same way as in a camera.

Smaller Films.

I have a quarter-plate folding camera with f/6 lens of focal length $4\frac{1}{2}$ in. Would it be possible to alter the film-pack adapter to take $3\frac{1}{2} \times 2\frac{1}{2}$ packs? If so, would this upset the focussing of the camera? And would the aperture of the lens remain the same for the smaller size? D. M. (Luton.)

It is sometimes possible to insert a fitting into a film-pack adapter to enable it to take a smaller pack. If this can be done in your case it will not affect the focussing in any way, providing that the extra fitting holds the film pack, as it should, at the same distance from the lens as was the original quarter-plate pack.

The smaller film will, of course, include a smaller amount of subject than before, but the lens-aperture, and consequently the exposure required, will be the same as for the larger size. Your view-finder will have to be marked down in some way to show the reduced angle of view, or you will not know where the boundaries of the picture are going to come.

Fitting a D.V. Finder.

How could I make, or get made, a direct-vision eye-level finder for a Goerz Tenax camera? Is it a difficult or expensive matter? And where should I apply to have the work done? K. N. P. (Dublin.)

There are several forms of direct-vision finders. If you mean a full-size wire-frame finder, this could probably be fitted to your camera, but the only way to find out would be to describe the camera carefully and then consult one of the repairing firms advertising in our columns. If the thing can be done at all one of these firms would do it, quoting you a price beforehand. If you prefer a direct-vision optical finder, these can be obtained at any large dealer's, either in folding or tubular form, and only require to be screwed to the body of the camera.

Three Months Abroad.

I am going to France for three months, and would like to take my camera (an Agfa Speedex O). Shall I have to pay duty on the camera or films when entering France? Or when returning to England? I have no receipt for the camera, nor do I know where it was bought, as it was given to me. G. B. C. (London.)

In going to France for holidays we have never been asked to pay duty even on quite expensive cameras, but we cannot say whether any payment will have to be made if you intend to stay there three months. We should imagine that you will have no difficulty at all in taking the camera through the Customs.

The French Customs do not charge duty on a reasonable number of rolls of film carried by a tourist. You may have some difficulty in getting the camera back into England at the expiry of those three months without paying duty on it.

We suggest that you apply to Messrs. Agfa Photo Ltd., 1/4, Lawrence Street, High Street, London, W.C.2, for an assurance that duty was paid on that camera when it was imported into England. This letter produced at the English Customs on your return would relieve you of any necessity to pay duty again.

Bringing Film Home.

I am going to Germany this summer, and as I normally do my own developing I should prefer to bring my exposed films home and develop them myself. Shall I have to pay duty on bringing them into England? And is there any regulation in Germany against taking undeveloped film out of the country? S. A. P. (Essex.)

We have frequently brought quite large quantities of exposed film back into England from abroad, and have never at any time been asked to pay duty upon it.

We do not think you will have any difficulty in taking undeveloped roll film out of Germany, unless some suspicion should arise that you have been exposing it in the neighbourhood of works of military importance. In that case it might be necessary for you to have it developed in order to prove that your photographs are of no military value.

Exposure at High Altitudes.

I understand that at high altitudes the correct exposure for a film is less than at sea-level. As I shall be spending my holiday among mountains I should be glad if you could tell me by how much my exposures should be reduced below normal. F. C. T. (Derby.)

The reduced exposure desirable at high altitudes is due to the fact that there is a great deal of ultra-violet light about, and that the eye, being insensitive to this light, does not make allowance for it when estimating exposures. The effect is noticeable in photographs of all types taken at altitudes over about 6,000 ft., above which height you should halve your exposures.

If you use a yellow filter, which cuts out ultra-violet light, the exposure immediately reverts to that which you would give using the same filter at sea-level.

Under these conditions the factor of the filter is therefore considerably higher than usual.

COMBINED LENS HOOD AND LIGHT FILTER

The "Rhaco" Combined Lens Hood, Light Filter and Filter Holder can be quickly attached to any ordinary lens mount. The "Orthoplan" filter is unmounted and can easily be removed when not required, thus allowing of the lens hood being used without the filter. "Orthoplan" filters are made from optical glass coloured in the mass during manufacture, and ground with plane parallel surfaces.

PRICES :

Model I, to fit lens hood $\frac{3}{4}$ in. to 1 in. diameter, including "Orthoplan" filter and leather case.....	12s. 6d.
Without filter.....	9s. 3d.
Model II, to fit lens hood 1 in. to $1\frac{1}{4}$ in. diameter.....	13s. 9d.
Without filter.....	10s. 0d.
Model III, to fit lens hood $1\frac{1}{4}$ to $1\frac{1}{2}$ in. diameter.....	18s. 9d.
Without filter.....	13s. 0d.

"Orthoplan" Yellow or Green Filter supplied.

THE FOUNTAIN PRESS, 19 CURSITOR ST., LONDON, E.C.4

The advantages of

"Dufaycolor is the most perfect system of additive colour photography yet devised in that it combines the following improvements over all previous processes :

1. Considerable increase in speed, permitting snapshot exposures with ordinary inexpensive cameras under a wide range of conditions.
2. Greater latitude in exposure.
3. Finer and very much less obtrusive colour screen elements.
4. Absence of frilling and blistering.
5. Absence of parallax.
6. Ease with which three-colour separation negatives can be made for preparing colour photographs or colour blocks for machine printing by any process. Monochrome negatives can be made, and from them black and white prints either by contact or by enlargement.
7. Ability to make duplicate transparencies without serious loss of colour."

This is an extract from the Dufaycolor Book which, in addition to a complete description of the process has special sections devoted to:—THE AMATEUR PHOTOGRAPHER; THE MINIATURE CAMERA USER; THE AMATEUR CINEMATOGRAPHER; PORTRAIT PHOTOGRAPHY; COMMERCIAL WORKS and PRESS PHOTOGRAPHY; TECHNICAL, SCIENTIFIC and CLINICAL PHOTOGRAPHY. Readers of Amateur Photographer are invited to apply for a copy of this book (post free 8d.) to Dufay-Chromex Limited, 14-16, Cockspar Street, London, S.W.1.

The London Salon of Photography 1937.

SENDING-IN DAY, Wednesday, September 1st.

THE TWENTY-EIGHTH EXHIBITION promoted by the Members of the London Salon of Photography will be held at the Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, S.W.1, from SATURDAY, 11th September, to 9th October, 1937.

CONDITIONS OF ENTRY.

(Please read carefully.)

1. Pictures must not be framed; but may be mounted or unmounted. Each picture must bear on the back clearly written (a) name of artist; (b) number and title of picture, corresponding to particulars on the Entry Form.
 2. When mounts are used they should conform to the following sizes— 25×20 , 20×16 , or 15×12 ; but no mount to exceed 25×20 ; and it is suggested that white or light-toned mounts be employed. Prints may be of any shape or size, provided they do not exceed the limits of the mounts as given above.
 3. All packages of exhibits from abroad must be clearly marked on the outside: "PHOTOGRAPHS FOR EXHIBITION ONLY—NO COMMERCIAL VALUE—TO BE RETURNED TO SENDER." *No prices to be marked on the prints.*
 4. Pictures sent unmounted will be suitably mounted by the Salon Committee, and all accepted pictures will be shown under glass.
 5. Pictures must be sent by post or parcels post, packed flat and properly protected with stiff cardboard and adequate wrappings, addressed to: THE HON. SECRETARY, THE LONDON SALON OF PHOTOGRAPHY, 5A, PALL MALL EAST, LONDON, S.W.1.
 6. All pictures for the exhibition must arrive at the above address *on or before* Wednesday, September 1st. Entries may be delivered by hand at the Gallery on that date only.
 7. The Entry Form for pictures from abroad must be sent SEPARATELY by post, together with entry and packing fee of 5s. (this fee covers any number of pictures from one exhibitor). Exhibitors residing in the British Isles may enclose Entry Form and fees with their pictures.
 8. Pictures sent by post will be repacked in the original wrappings and returned, carriage paid, after the close of the exhibition.
 9. As applications are made from time to time to The London Salon of Photography for permission to reproduce pictures from the walls of the Gallery, exhibitors are asked to signify, in the space provided on the Entry Form, whether they have objection to such permission being given. The copyright in all cases remains the property of the authors of the prints.
 10. The Committee assure intending exhibitors that the greatest care will be taken of all work submitted, but they do not accept any responsibility for loss or damage, either during transit or at the Gallery.
- If pictures are sold a Commission of 15% is payable to the Salon.
The submission of pictures will be understood to imply acceptance of the above conditions.
Notification of acceptance of pictures will be sent out as soon as possible.
A Catalogue will be sent to each exhibitor.

Entry Forms and further particulars from the Hon. Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1

"THE A.P."

Special Competition for Novices

THIS competition is specially for Novices, that is to say, those amateur photographers who have never won an award of any description in a photographic competition, and preferably those who are only just starting photography.

The prizes will be awarded for the best snapshots of subjects that the beginner usually attempts. These include snapshots of the family, groups or single figures taken at home or on holiday, either indoors or outdoors, and landscape and beach scenes, etc., with figures. The arrangement of the subject and the pose of the figure or groups is a matter left entirely to the discretion of the competitor.

The entries will be restricted to contact prints. These may be mounted if preferred, and the smallness of any print will not affect its careful consideration in this competition. The rules are very simple, but should be read carefully.

THE PRIZES.

The prizes in this competition will consist of supplies of roll film or plates (for those winners who happen to use a plate camera), as follows:—

The First Prize will be TWO ROLL FILMS EVERY WEEK FOR ONE YEAR.

The Second Prize will be TWO ROLL FILMS EVERY WEEK FOR SIX MONTHS.

The Third Prize will be ONE ROLL FILM EVERY WEEK FOR SIX MONTHS.

Twelve Prizes of ONE ROLL FILM EVERY WEEK FOR THREE MONTHS.

RULES.

Each print must have affixed firmly to the back a coupon which will be found in our advertisement pages each week. This must contain title of print, and name and address of competitor. The latest date for receiving entries is September 30th.

The copyright of all prints entered remains the property of the authors of the photographs, but the right is reserved by "The A.P." to reproduce the winning prints and any others that may be worthy of mention. The decision of the Editor in all matters relating to this competition must be accepted as final.

All entries must be addressed to: The Editor, *The Amateur Photographer*, Dorset House, Stamford Street, London, S.E.1, and the outside of the envelope or package must be clearly marked "Novices' Competition."

THE NEW *Excelsior* PHOTO-ELECTRIC EXPOSURE METER

- Readings of "stop for speed" or "speed for stop" AT A GLANCE.
- Still or Ciné.

Simplicity and Speed—Easy to read as telling the time by a watch. Only one adjustment.

Compact—Enclosed in a neat leather case.

Reliable—Accurate and a real precision instrument.

Interior Pictures—An auxiliary scale for bad lighting conditions.

Still or Ciné—Graduated for both shutter speeds and Ciné Frame Speeds.

Photo-Electric Cell is extremely sensitive, giving exposures from 120 seconds down to 1/2,000th of a second.

Sole Distributors for Great Britain and Ireland:
ENSIGN, Limited, HIGH HOLBORN, LONDON, W.C.1

TAKE A Rolleiflex

AND COME BACK WITH A SUPERB COLLECTION OF HOLIDAY PHOTOGRAPHS

Simplicity in use—Superlative results—those are the reasons why the Rolleiflex is ideal for holiday photography. You can compose and focus your picture, adjust your aperture and shutter speed all at the same time. Your picture, being full size and right way up, is big enough even to allow you to see changing facial expressions—and tells you exactly when to snap. Gives 12 pictures $2\frac{1}{2} \times 2\frac{1}{2}$ on $3\frac{1}{2} \times 2\frac{1}{2}$ roll film for 1/-, which can be obtained everywhere, and special development is not necessary. One-lever Compur-Rapid shutter, speeded to 1/500th sec., T. and B. Zeiss Tessar f/3.5 lens.....£25

LENS
SCHNEIDER TELE-XENAR
f/5.5 = 5 cm. £10 0 0

- Shoots sequence pictures with machine-gun speed.
- Film winds itself automatically.
- Shutter sets itself automatically.
- Film counter operates automatically.
- No double or overlapping exposures possible.
- Automatic "Zone" focusing gives needle-sharp definition and supersedes range-finders.
- Takes up to 50 exposures on standard 35-mm. film.
- Dual cassette loading permits removal of any part of film at any time for development.
- Camera opens in daylight for changing from "pan" to colour film at any moment.
- With motor wound, takes from one up to 24 exposures in quick succession, or singly.
- Motor can be left permanently wound.
- Incorporates filter suitable for "pan" or "ortho" films.
- Exposure automatically compensated when using filter.
- Shutter gives Time and from 1 sec. to 1/500th sec., and all intermediate speeds.
- Weighs 14 oz. Just heavy enough to be held comfortably without risk of movement.
- Overall size only 4½ x 2½ x 2 in.
- Three view-finders in one, including "right-angle" for "candid" work.
- Daylight loading spools available.
- Camera has stainless steel body covered black morocco.
- Interchangeable lenses.

MISCELLANEOUS ADVERTISEMENTS

Prepaid Advertisements

THE CHARGE FOR ADVERTISEMENTS IN THESE COLUMNS IS:—

12 words or less.....2/6
2½d. for every additional word.

Each paragraph is charged separately.

SERIES DISCOUNTS are allowed to Trade Advertisers as follows on orders for consecutive insertions, provided a contract is placed in advance, and in the absence of fresh instructions the entire "copy" is repeated from the previous issue: 13 consecutive insertions, 5%; 26 consecutive, 10%; 52 consecutive, 15%.

All advertisements inserted in these columns must be strictly prepaid, and reach the offices, Dorset House, Stamford Street, S.E.1, not later than first post Friday for the following week's issue, or one day earlier at the Branch Offices, 19, Hertford Street, Coventry; Guildhall Buildings, Navigation Street, Birmingham, 2; 230, Deansgate, Manchester, 3; 26a, Renfield Street, Glasgow, C.2.

Advertisements received too late for one issue, or crowded out, are published in the first following in which there is space. The Proprietors retain the right to refuse or withdraw advertisements at their discretion.

The Proprietors are not responsible for clerical or printer's errors, although every care is taken to avoid mistakes.

Box No. Advertisers

If a Box No. is required, the words "Box 000, c/o 'The Amateur Photographer'" should be included in the charge, and an additional 6d. sent for registration and cost of forwarding any replies.

Letters addressed to box numbers are simply forwarded by us to the advertisers. We do not deal with the correspondence in any other way, nor accept any responsibility in connection with the advertisements.

SHEFFIELD PHOTO CO. LTD
NORFOLK ROW, (FARGATE)
SHEFFIELD — One minute walk from Town Hall

Deposit System

Readers may deal in safety through our Deposit System. Purchase money should be deposited with "The Amateur Photographer and Cinematographer," when both parties are advised of its receipt. The time allowed for decision is three days, counting from receipt of goods, after which period, if buyer decides not to retain goods they must be returned to sender. If a sale is effected, buyer instructs us to remit amount to seller, but if not, seller instructs us to return amount to depositor. Carriage is paid by the buyer, but in event of no sale, and subject to there being no different arrangement between buyer and seller, each pays carriage one way. The seller takes the risk of loss or damage in transit, for which we take no responsibility. For transactions up to £10 a deposit fee of 1/- is charged; over £10 and under £50, 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; over £100 one-half per cent. All correspondence must be sent to Dorset House, Stamford Street, London, S.E.1.

Cheques and Postal Orders sent in payment for deposits or advertisements should be made payable to ILIFFE & SONS LTD., and crossed

& Co.

Notes being untraceable if lost in transit should not be sent as remittances.

WARNING

We have received many complaints from our readers in regard to the business methods of Mr. R. L. Green, trading as R. L. Green's Photographic Exchange, of 218, Fore Street, Edmonton, London, N.18, or (possibly with different initials) as Cine Photo Supplies, 4, Holborn Place, High Holborn, W.C.1.

For some considerable time we have refused to insert his advertisements in "The Amateur Photographer and Cinematographer," and from the complaints we have received it would appear that his practice is to communicate with private advertisers having goods for sale, offering to take such goods in exchange for others, or to purchase for cash. Readers are advised to ignore all such offers from this quarter.

SECOND - HAND CINÉ APPARATUS WITH A SIX MONTHS' GUARANTEE!

When you purchase a used movie camera or projector from us, you pay no more for it than you would to any other ciné dealer, and quite often a great deal less. Yet there is a difference! We guarantee every instrument we sell, and should any defects become apparent within six months from the purchase date they will be adjusted promptly and cheerfully. All who deal with us are loud in their applause for our general service, which is unequalled elsewhere.

FINEST MOROCCO
LEATHER COVERING

ALL METAL
BODY

REAL
LEATHER
BELLOWS

THE CAMERA COMPANY are proud to announce this exclusive new Vauxhall Super-Minicam with Coupled Range-finder.

Here is a coupled range-finder miniature, fitted with the finest quality f/2.9 anastigmat lens in delayed-action Compur shutter, selling at a price which YOU can afford. Actually its nearest competitor is approximately 40 per cent higher priced —BUT the Vauxhall has numerous advantages not to be found in other cameras of this type.

For instance, it takes two sizes of picture according to choice—either twelve 2½ in. square or 16 2½×1½ in. Another exclusive feature is the special radial focussing lever which automatically springs back into the infinity position when the camera is closed, thus preventing any possible damage to the camera or focussing mechanism.

PRICE £11 15s. ONLY

Yours for 20/7 down and eleven similar monthly payments.

★ SEND FOR LEAFLET ★

STANDARD MINICAM

(without Coupled Range-finder)

This popular model is of similar construction and specification as the above Super-Minicam, with the exception that it has a direct-vision optical view-finder at the side in place of the coupled range-finder. Also micrometer lens focussing is fitted instead of the radial focussing lever.

PRICES:

2½ square or V.P., f/2.9 anastigmat, Compur shutter **£6 : 19 : 6**

(Or under our SELF-FINANCED Hire Purchase Terms of 12 monthly payments of 12/3.)

Ditto, with Prontor II shutter **£5 : 19 : 6**

(Or under our SELF-FINANCED Hire Purchase Terms of 12 monthly payments of 10/6.)

ENSIGN

'CLIP-ON' DIRECT-VISION OPTICAL VIEW-FINDER

Fits ANY Camera

For $2\frac{1}{2} \times 3\frac{1}{2}$ or TWO-ON $2\frac{1}{2} \times 1\frac{1}{2}$ size pictures.

Can be instantly attached to all types of folding cameras by means of a spring clip. It only measures $1\frac{1}{2} \times \frac{3}{4}$ in., and can be slipped into the waistcoat pocket when not in use. The detachable cover is provided with two mask sizes; the larger size, $2\frac{1}{2} \times 3\frac{1}{2}$ in., at one end, the smaller size, for $2\frac{1}{2} \times 1\frac{1}{2}$ in., at

the other. The change from one to the other is effected simply by gripping the cover at both ends, lifting off and reversing.

Price 6/6

UNIVERSAL BALL-AND-SOCKET HEAD

Enables a camera to be set at any angle. Also for using the tripod for supporting the camera in a vertical position for such work as photographing pages direct from books, small objects, coins, maps, and any object which comes within its range.

For use with any camera 3/6

Midget pattern. Very compact.....3/-

New 1937 SUPER-BEWI Photo Electric Exposure Meter

With extra-sensitive everlasting photo cell and combined optical meter for still or ciné. Can be carried in the waistcoat pocket without difficulty. Measures weak interior light by means of a built-in optical meter. Shows at a glance diaphragms from f/1.4 to f/36, and from 1/3,000th sec. to 1 hour. No calculations. Suitable for all negative emulsions. Fitted with depth-of-focus scale.

Super Bewi £5 5 0

Standard Model £4 10 0

NEW!

STRIP PRINTS FROM LEICA and OTHER 36-EX- POSURE 35-mm. FILMS.

Here's a chance to
get contact prints at
less than a penny each.
We are doing a full
36-exposure strip of
prints on paper at
2/6 or on transparent
film, so that you can
project them as "stills"
on the cine screen, for
5/- per 36 exposures.
Give this service a trial—
you can always depend
on quality work at Bond
St. These are made in
the finest D. and P.
works in the country.

The AMATEUR ^{4^p} PHOTOGRAPHER

& CINEMATOGRAPHER

~ The Journal for Everybody with a Camera ~

Vol. LXXXIV.

Wednesday, August 18th, 1937.

No. 2545.

A Rolleiflex PICTURE

There is no camera to equal the Rolleiflex in the ease with which it captures good pictures. The number of valuable cash prizes won by amateurs using Rolleiflex fully substantiates this claim. Holiday photography with the Rolleiflex is more enjoyable because you can forget technicalities. The $3\frac{1}{2} \times 2\frac{1}{4}$ roll film, which it uses, can be obtained wherever you happen to be, and your spools do not need special development. You get 12 $2\frac{1}{2} \times 2\frac{1}{4}$ pictures on a spool for 1/-. You see your pictures full size right way up and pin-point focussing is quick and easy. It is simple to manipulate—superlative in results. With f/3.5 Zeiss Tessar lens and Compur Rapid shutter speeded to 1/500th sec., T. and B., the Rolleiflex costs only £25.

Prospectus and address of nearest stockist post free from the Sole Importers:

R. F. HUNTER LTD., "CELFIX HOUSE," 51, GRAY'S INN ROAD, LONDON, W.C.1
Phone: Hol. 7311/2.

The artistic use of back-lighting demands much of the photographer and also of his film. The success of the accompanying enlargement (where the sun is only obscured by a single tree) could not have been achieved without the wide tone gradation and full panchromatic quality of Kodak Panatomic film.

KODAK
'PANATOMIC'
FILM
Panchromatic, double-coated, anti-halo

MOTORISTS**... DO YOU REALISE THAT***If you reduce your mileage
by only 60 miles a week***YOU CAN BUY A****Leica****CAMERA—IF YOU BUY IT FROM US**

If you own a "7" you probably hanker after a "10"—if it's a "10" you long for a "14"—and it's not long before you get it. Yet you are content to jog along with an antiquated roll-film camera half as big as a house, because you imagine you can't afford a Leica. This year we have convinced a great number of photographers that Leica photography is easily within their reach. To illustrate how little it costs on Wallace Heaton's e-x-t-e-n-d-e-d payments you would only need to reduce your mileage by 60 miles a week to be able to enjoy Leica photography. Next week-end let your trip be to Worthing instead of Bournemouth—put the difference in cost by and you're on the way to the greatest pleasure in photography. Write us now—ask us to quote you on your present camera. Our easy payment system is absolutely confidential, and each transaction is conducted throughout in the friendliest manner. A day or two after writing you'll be able to have your Leica and get the fullest pleasure out of your motoring.

COMPETITION**

Think what a scope a holiday gives for the subject. Pictures beaming with life and laughter can be seen on every side—snap them and send some in! There is no entrance fee. It's an opportunity to win money while you and your friends are having the time of your lives. Originality will score up to a point in your efforts—but good photography is the vital asset. Start thinking about this competition as soon as your holiday train starts off—a good prize may be your reward.

FIRST PRIZE £25 ★ WEEKLY PRIZE 21/-

- All entries to be judged by Wallace Heaton Ltd., whose decision shall be final.
- **AMATEURS ONLY** (Full name, address, title of entry and coupon shown in this advertisement on back of each entry).
- **ANY MAKE OF CAMERA or MATERIALS.** DEVELOPED, PRINTED OR ENLARGED ANYWHERE. ANY SIZE MOUNTED OR UNMOUNTED (not less than 8×6 unmounted is recommended).
- **WALLACE HEATON LTD. HAVE THE RIGHT TO PURCHASE THE NEGATIVE AND COPYRIGHT OF ANY PHOTOGRAPH SUBMITTED FOR TWO GUINEAS, OR THE RIGHT OF ONE REPRODUCTION FOR 10/6.** (If a guinea prize-winner for an extra guinea.)
- Copyright of the £25 prize-winning photograph and negative becomes the property of Wallace Heaton Ltd., without further payment.
- Prizes are 21/- each week and 6 Certificates of Merit. £25 (Twenty-five pounds) for the best photograph submitted during the competition (13 weeks).
- If stamped addressed envelope is enclosed every endeavour will be made to return photographs to competitors. No guarantee of safe return can be made and no entries will be returned unless above is complied with.
- Acceptance of these rules, etc., is a condition of entry.
- A selection of the best entries will be held back at the close of the competition for exhibition in our galleries prior to their return. Our gallery is *always* interesting, call and see it when in Town—free, of course.

ORGANISED COLLABORATION INVALUABLE

This same amateur photographer, utilising J.P.D. Services, and under our organised guidance, has earned £80 from his camera during the comparatively short period he has been associated with us. The pictures are taken in spare time only, and he freely admits that before being shown by us how to get the type of human interest pictures Editors crave, he knew absolutely nothing about either a camera or camera journalism. Complete credit for his success is unreservedly accorded our Organisation.

VAST MARKET. J.P.D. Photo Services are available to any amateur photographer who genuinely desires to produce saleable pictures in his or her spare time. Some 6,000 British Newspapers, Magazines and Advertisers buy literally hundreds of thousands of photos every year. This fine, permanent market is open to those who know what to take, and **How** and **Where** to sell.

We show you **What, How** and **Where** through the medium of our established Fleet Street facilities. You too can emulate the Member's accomplishment described above. No special camera, equipment or previous experience is required.

VALUABLE OFFER. Every amateur photographer should investigate this intensely interesting means of making an otherwise expensive hobby pay for itself. It would give us pleasure to send to you upon request a complimentary copy of our helpful book entitled "Making Money with Your Camera." No obligation on your part, of course. We will also send you full information as to scale of payment for photographs.

SEND US YOUR PHOTOS. You are invited to submit to us a selection of your present photographs, some of which may possess journalistic worth. In any event we will freely give you our opinion as to their potential value. Call personally, or write, using coupon.

VALUABLE COUPON

Journalistic Photo. Distributors Ltd., Dept. HU.
Ludgate House, Fleet Street, London, E.C.4

Sirs,—Please send me free and without obligation your fully illustrated book "Making Money with Your Camera," also scale of payment for pictures and particulars of J.P.D. Free-Lance Services. I enclose selection of my snaps; kindly let me know their journalistic rating (cross out latter sentence if not applicable).

TO OVERSEAS AMATEUR PHOTOGRAPHERS

Your inquiries are cordially invited.

PHOTO-ELECTRIC METERS

FOR EVERY PHOTOGRAPHIC NEED

The NEW SUPER-SENSITIVE METER

Gives direct readings in relatively dark interiors as well as very bright exteriors. Scale clearly shows readings, from 1/1,000th sec. to 4 minutes. The "Sixtus" has no tables, yet it is capable of use with any film from 6 DIN. 17° Scheiner to 21 DIN. 32° Scheiner and with lenses from F/1.4 to F/45. It is self-contained in bakelite ever-ready case from which it is not removed when in use. Weighs 5 oz. and measures 2½ x 2 x 1 in.

Price 5 gns.

FOR THE LEICA

A model specially calibrated, covering the individual shutter and iris readings, is now obtainable.

Price 5 gns.

PURMA SPECIAL

**A NEW KIND OF MINIATURE CAMERA
EASIEST TO USE · CHEAPEST TO RUN
OFFERS A WIDE RANGE OF PHOTO-
GRAPHY FOR THE LOW COST OF 50/-**

Purma Portrait Attachment, 3/6. Ever-ready leather carrying-case with shoulder strap, 10/6. Carrying sling, 2/6.

Enlargement from a PURMA SPECIAL picture. Actual size of contact print is $1\frac{1}{2} \times 1\frac{1}{2}$.

The cleverness of the design of the PURMA SPECIAL lies in the absence of knobs to turn and gadgets to confuse—and in its ability to produce good photographs in all weathers. Tests have proved it. Nothing could be simpler to operate. There is no focussing—everything from 12 ft. to infinity is dead sharp—no lens aperture or speed dial to set—no calculations of any kind.

The highly efficient all-metal focal-plane shutter has three speeds capable of dealing with poorly-lighted subjects up to the quickest action. The speeds are $1/25$ th, $1/150$ th and $1/450$ th sec. The adjustment of speed is automatic—decided by one of three ways of holding the camera. A fast $f/6.3$ lens. 16 pictures ($1\frac{1}{2} \times 1\frac{1}{2}$) on ordinary vest-pocket roll film for 1/-.

With the Purma Special no opportunities are lost. Remember there are no adjustments to make—the camera is always ready for action—you just hold it up and shoot—as simple as that—and as quick. And you can get clear, crisp pictures every time.

The **Voigtländer** RANGEFINDER BESSA
... a Camera that looks
after everything for you!

THE Rangefinder Bessa has every imaginable feature for accuracy with ease. Focussing is merely a matter of glancing through the coupled rangefinder and turning a wheel—you see when the picture is in focus, and you take it instantly with the unique Bessa trigger-release which is fitted under the baseboard. The Bessa is held in both hands at eye-level, with no risk of shakiness. An interchangeable built-in light filter, mask for half-size pictures, Compur-rapid delayed-action shutter and a Voigtländer f/3.5 anastigmat lens, combine to make the Rangefinder Bessa amazing value.

See it at your dealers—or send for the Rangefinder Bessa Brochure—now!

- For 8 exposures $3\frac{1}{2} \times 2\frac{1}{4}$ or 16 half-size, £16 10 0 with f/3.5 Helomar lens. Other models at £18 15 0 and £21 0 0.

THE AMAZING EFFICIENCY OF THE

*Agfa Karat*PERMITS LOADING AND
6 SHOTS WITHIN 20 SECONDS

The essence of successful action photography is getting your shot in at exactly the right moment. Completely reloading the Agfa Karat and taking a succession of shots is only a matter of a few seconds. You just drop in the cassette, pull out an inch or so of film, place on the sprocket, clip it down, shut the camera and shoot away. This can be done in less time than it takes to read it. No waiting until you can run off 36 shots. 12 exposures and out comes the cassette ready for developing. Other features include automatic lock, preventing double or blank exposures.

Automatic picture counter. A good quality f/6.3 lens, 'Automat' shutter giving 1/25th, 1/50th, 1/100th, T. and B. Optical viewfinder. Snap-open action and convenient placing of all controls. And a quality and finish of a camera costing much more than its cash price of £5 5s.

VOL. LXXXIV. No. 2545.

OUR readers are reminded that the last day for sending in pictures for the London Salon of Photography is Wednesday, September 1st. The Exhibition will again be held at the Galleries of the Royal Society of Painters in Water Colours, 5a, Pall Mall East, London, and parcels of prints for the Salon may be delivered by hand at that address on or before the above date. While entry forms for pictures from abroad must be sent separately by post, exhibitors residing in the British Isles may enclose them with their pictures. Entry forms are obtainable from the Hon. Secretary at the above address. The Salon opens to the public on Saturday, September 11th and remains open until Saturday, October 9th. The private view will be on Friday, September 10th. All who submit prints will receive an invitation to this function. A note of advice to those sending pictures to the Exhibition is included with every entry form, and in view of the excellent tips it contains is reprinted for the benefit of our readers on another page in this issue.

The Royal Album.

We have already drawn attention to the album of amateurs' photographs of the Coronation celebrations that is being prepared by the Photographic Dealers' Association for presentation to Their Majesties The King and Queen. These photographs have been sent to the P.D.A. from all parts of the country and depict the celebrations from every angle, both by day and by night. The prints that will be finally selected will be specially prepared from the original negatives, and in each case the author will receive a certificate recording the fact that

TOPICS of the Week

IN A CORNISH HARBOUR.

Subjects such as this, and many others, can be found at the seaports and fishing harbours round our shores.

(See article "In Ports and Harbours" in this issue).

his work has been included in the Royal Album. Our readers who submitted prints for "The A.P." Coronation Competition (the awards for which were published last week) will be pleased to know that we have been enabled to place before the selectors a considerable number of the best that were sent to us, and we hope that many will be chosen for the honour. They will receive a communication in due course from the Secretary of the P.D.A. The Album, when completed, will be a notable record by amateur photographers, and Their Majesties will doubtless be greatly interested to see the many phases of what was done in different parts of Great Britain to celebrate the great event.

Amateurs' Failures Fifty Years Ago.

The notes under "If you Prefer Plates," in a recent issue, have led a correspondent to recall some remarks made nearly fifty years ago by Mr. E. J. Wall, for some years editor of "The A.P." Mr. Wall joined the staff in September, 1887, when plates had no rival in the shape of films, and his task was to answer technical questions and help readers out of their difficulties, and many were their difficulties in those early days. After about a year of dealing with troubles connected with exposing, developing, etc., Mr. Wall gave a lecture before one of the London clubs, and some of his remarks and findings make interesting and most peculiar reading to-day. He said that his task of helping amateurs led him to believe that the average amateur got twelve really good negatives from his first hundred exposures; the remaining eighty-eight he classed as: Passable, 25;

fogged, 20; under-exposed, 10; over-exposed, 30; damaged or broken, 3. This does not mean that the plates were faulty—they were, in fact, remarkably good. It means that photography was far more difficult for the amateur than it is to-day.

Sending by Post.

A cry of the heart reaches us from one of those few people—few but relatively many—who stay at home in August while the rest of the family goes to the seaside. Young people being what they are, it is inevitable that after a day or two a post card should arrive to the following effect: "Having a lovely time. In hurry of packing forgot camera. Please send on." It is easy to write such a post card, less easy to do what it asks, or at any rate to do it without misgiving lest something happens to the delicate construction confided to His Majesty's Mails. Cameras being of all shapes and sizes, a standard container for posting purposes is out of the question, but our manufacturers have wonderful ingenuity

and resource, and we wonder whether they could not give us—if they have not already done so—some kind of protective cover, warranted not to exasperate the sender by the difficulty of doing up the package, nor to anger and disappoint the recipient by proving an inadequate shield for the camera against the dangers of postal transmission.

The Over-Photographed Baby.

A couple of proud parents insisted before introducing their offspring to us that we should examine his photographs. He was but eighteen months old, and a little calculation showed, as his photographs straggled their way through two big albums, that he must have been photographed on the average twice every week of his life. He was shown in every conceivable posture, in every mood within the range of a baby's capacity to display, in every position in which the cruelty of fond parents might dispose him. After we had studied all these snapshots, not being allowed to skip any of them, the introduction of the infant came as an anticlimax. Perhaps it was

that the photographs had led us to expect too much, or possibly we had grown tired of the subject before he appeared, or, perhaps again, the many times he had been photographed had left their mark upon him, and he was not the baby he used to be. Anyhow, he seemed flatter than the worst of his portraits, which is an awful warning against photographing a baby too often. The N.S.P.C.C. might well have a department for protecting children against over-use of the camera during infancy.

Pleasures to Come.

We have come across a man, a business man, in London too, who has never seen a moving picture. Well, except once, and that by accident, when he noticed, in passing, a shop window display. But of the vast apparatus for amusement and entertainment which the film reel signifies he knows nothing. He tells us that he has discovered one other person like himself—a yokel in Essex. One rather envies him, just as one envies a man who has never read "Pickwick."

READERS' PROBLEMS

Selected queries on topics of general interest to readers will be fully dealt with under this heading week by week. Other replies appear as usual on the last page.

Condenser or Diffuser.

In enlarging it is held that diffused light reduces contrast in the print as compared with direct condenser light. Why is this, seeing that contrast is in the negative itself? Which is the better form of lighting to use? E. I. (Basingstoke.)

We have often dealt with these points, but the questions you raise are constantly arising and of considerable importance.

It was formerly thought that the best illuminant for an enlarger was an approximation to "a point of light." Some of the rays from this were collected by a condenser and brought to more or less sharp focus at the lens, the position of which had to be adjusted with considerable nicety to secure even illumination.

When the vertical enlarger began to come into use there were reasons for adopting diffused illumination, and with a suitable lamp, reflecting lamp-house and diffusing screen, it is possible to secure even but softened illumination of negatives up to certain sizes even with a single lamp.

Diffused or "scattered" light is naturally weaker than direct and uninterrupted beams of the same original intensity, and the reduction in contrast to which you refer is due to what is known as the Callier effect. Direct condenser light passes uninterruptedly through the clear parts of the negative; where there is a slight deposit of silver the light is slightly scattered; the denser the deposit the greater the scatter. Hence while the shadows are fully exposed the highlights are held back more or less according to density. Hence the greater contrast.

When all the light that reaches the negative is already scattered the additional scatter from the silver deposits is not so marked, and contrast is reduced.

The tendency now is to avoid direct condenser light. Sometimes nothing more is done than to substitute for a clear light a lamp with an opal or semi-opal bulb. A "pearl" bulb may not give sufficient diffusion. In any case further diffusion is often secured by a sheet of finely ground glass, generally between lamp and condenser. There is much to be said, however, for ground glass or matt celluloid in front of the condenser, so that it intervenes between condenser and negative.

When this arrangement is properly made the negative is brilliantly and evenly illuminated, and the effects of blemishes, retouching and grain in the negative are reduced to a minimum.

Sodium Carbonate.

There has been some talk lately about using washing soda in formulae giving soda carbonate. What kinds of carbonate are available? Which is the best? E. J. A. (London.)

Although some samples of commercial washing soda may be good enough for photographic purposes others might be unreliable. The quantities used are so small, and the cost so low that we consider it advisable to use a good standard product as sold for photographic and other purposes.

The formula of the crystal form is $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$. The crystals should be small and clear, and make a clear solution in water. The anhydrous (dry) form is Na_2CO_3 , that is, there is no water of crystallisation. This dry form must be protected from damp in a well-corked bottle or airtight tin.

In making up formulae 160 grs. of the anhydrous form may be taken as the equivalent of 1 oz. of the crystal form. It dissolves very readily.

Preparing Exhibition Prints

The Autumn Exhibitions will very soon be upon us, and the wise exhibitor will start preparing his entries now unless he has already done so. The suggestions contained in this article should be of considerable value to him in this connection.

It is the ambition of most photographers to see their work displayed upon the walls of the leading photographic exhibitions. This is as it should be, because this is not only a test of the photographer's ability, but also affords a means of comparing his best work with that of other photographers.

The photographer who cherishes the hope of having one or more prints "accepted" by the selecting committees of one of the first-class exhibitions that will be opening during the autumn or early winter months will do well to consider the subject early in the season. It is admitted that some last-minute efforts are successful, but acceptance is more likely if the photographer gives careful attention to the subject well before the closing date. It is possible that faults in a print escape notice when the print is first made, but they very often become evident after the print has been made a little while. Moreover, the photographer is more critical, and therefore more likely to notice weakness, after the first thrill of production has passed.

The Subject.

It is the aim of the selecting committees at all the important photographic exhibitions to display only those prints which are noteworthy. A high standard is set, and this means that many prints which are good examples of straightforward photography fail to secure acceptance. A survey of any modern exhibition will indicate that most of the subject matter is commonplace, but it is in the handling of the subject, or the point of view chosen by the photographer, that personality is exhibited. This applies both to the traditional subject as well as to those seen and treated in the "modern" manner.

The Print.

It need hardly be said that the print needs very careful consideration. There is no process more "artistic" than another, and mastery of the printing process is essential in order that the photographer shall obtain the best results from it; the intending exhibitor will therefore do well to employ the

or coarseness of texture that may escape notice in a print of smaller dimensions.

Exhibition rules suggest, if they do not enforce, light-toned mounts. It is recognised that these are best both for the average print and for the appearance of the exhibition as a whole. A mount of suitable tone and texture can enhance the quality of a

good print, a point that many exhibitors seem to fail to realise. As mounting may be done by an outsider the photographer who is not able to mount his prints neatly will do well to take advantage of professional assistance.

Finally, the photographer should make quite certain that the print is of the finest quality that the negative will give. While the selecting committee are engaged in the inclusion of prints of a pictorial rather than a technical order the latter has consideration if only for the reason that a print of indifferent quality will not only appear less pleasing, but it will certainly fail to make the best of the subject. Small matters may make all the difference between a fine picture and one that just fails to reach its objective.

In General.

The print should be carefully looked over with regard to the rules which govern the exhibition in order to ensure that the conditions are complied with. Special attention should be given to the note concerning the class and the affixing of the author's name, and other details, not forgetting the return postage. Care should also be taken to pack the print securely so that it will reach the selectors in good condition, and stand up to the handling it will receive in transit. And above all, the entry should be dispatched well in advance of the closing date.

- ¶ If you mount your prints cut the mounts the correct size. Do not use heavy cardboard, thick mounting paper is best.
- ¶ Write the title, and under it your name and address in block letters in the left bottom corner of the back of every print or mount.
- ¶ If you must employ an overlay cut-out mount stick it down at the base as well as at the top—otherwise it may get torn or damaged.
- ¶ If your print needs protection when removed from the packing, don't use tissue paper. Use a stout paper and stick it on the back of the mount at the top and fold over to cover the front. See that it is not oversize or it will show when folded back.
- ¶ Do not use large mounts for small prints. As a general rule print size should not be less than 8×6 in. on 12×10 in. mount; 10×8 in. on 15×12 in. mount; 15×12 in. on 20×16 in. mount; and 20×16 in. on a 25×20 in. mount. Do not put a 15×12 in. print landscape way on a 25×20 in. upright mount: instead use a 20×16 in. mount the same way as the print.
- ¶ Read the conditions carefully and compare your entry with the particulars you have written on the entry form before dispatching.
- ¶ Pack your prints adequately, but with no superfluous packing. Send them only by post, parcel post or deliver by hand.

The above notes are a copy of those sent by the London Salon of Photography to intending exhibitors, and the advice contained therein should be of interest to all who are making exhibition prints.

process with which he is most familiar.

Prints for exhibition walls need to be stronger in tone than those meant to be hung in an ordinary room. Lighting conditions are stronger, and a print that is in the least lacking in depth and tone quite loses its force when seen in competition with others.

Presentation.

The size of the print is also an important matter for consideration. Size is not in itself a merit, but a large print may often convey a better impression of a subject than a small one, especially if the subject is on the large scale. In these days of small negatives the photographer must beware of what may be termed "over-enlargement." The latter brings into prominence grain

In PORTS and

By ALAN E. PURCHES.

WOODEN WALLS.

AT this time of year seaports and harbours, especially the smaller ones where the staple trade is fishing, are enjoying a big influx of holiday-makers. Most of them bring cameras, and of the exposures made it is probable that the large majority are expended on waterside or dockside subjects.

While it would be absurdly untrue to say that any photograph including water is necessarily superior to one that does not, the fact remains that water, whether it be a river, a lake, a harbour or the open sea, is invariably an attraction to every camera user. Villages, towns, and

PASSING THE TIME OF DAY.

landscapes may leave the photographer uninterested, but water, even if it is only the village pond, always seems to call the camera forth from its case.

It is not very easy to say with any certainty wherein lies the universal pictorial appeal of water. Perhaps it is to be sought in the reflections that in one form or another are always present, or perhaps simply in the fact that water is always broken up, if not by reflections, then by ripples or light and shade, and so enables the photographer to escape at once from the recurrent difficulty of "empty foreground."

Of all forms of water, the open sea probably presents the least amount of variation in texture and lighting—except, of course, where foreground studies of waves come

IN AN ANCIENT TRADE.

into the question. From this point of view, in particular, a harbour is an especially good place for picture-making, on account of the variations in light and shade on the water brought about by surrounding buildings and by the wharves themselves. The illustration "Passing the Time of Day" is a good example of this, the darker part of the water being due, apparently, to the reflection of some building or other raised object.

In a harbour, too, the water is always enlivened by incident of one sort or another, and this incident is constantly changing in character and re-forming itself into new

August 18th, 1937

HARBOURS

One of the most profitable localities for picture-making at this time of year is undoubtedly a seaport or fishing town, for few places offer such opportunities for photography as a busy harbour.

and ever more delightful compositions. The grouping of boats in the illustration just referred to is clearly of the evanescent type; a few moments earlier or later would have yielded quite a different picture from the same viewpoint. The same is true of "A Summer Day," and there can be no doubt that in any moderately busy harbour photograph after photograph can be taken of such scenes as these without undue duplication of subject matter or interest.

Although the reproduction is made from the whole negative in "A Summer Day," careful inspection of this little picture will reveal that it contains other pictures within it, these being discoverable by suitable trimming and subsequent enlarging. Two such "subjects within a subject" leap to the eye; both are vertical compositions, one taking the foreground boat on the right as the principal object, while the other centres round the small sailing boat and the reflection of its bare mast. Almost any harbour subject that is as crowded with incident as is this one will reveal unsuspected pictures if looked into carefully. The usual pair of L-shaped cards are

SAFE IN HARBOUR.

vividly brought to mind by no more than a glimpse of water under the bows of a boat.

Even with no water in the picture at all, there is no difficulty in suggesting the sea. "In an Ancient Trade" shows no water, but the juxtaposition of sails and masts with the recently-unloaded cargo tells a story that calls up vivid pictures of deep-sea sailing.

Photographically, a harbour is in many ways an easy place in which to operate. Though boats move fast enough to provide perpetual variation of subject, they do not require either high shutter speeds or even very

quick handling of the camera to catch a picture before it is lost. And the bright light characteristic of the seaside enables a filter and a moderate stop to be used, making focussing extremely easy.

A SUMMER DAY.

a great help to the eye in choosing the best boundaries for the new composition.

The interest of a harbour, however, is not by any means confined to subjects consisting largely of an expanse of water. In "Wooden Walls" and "The Day's Work is Over" very little actual water is visible, but they bring the salt tang of the sea with them none the less. In all forms of picture-making suggestion is at least as important as explicit statement, and the wide ocean can be

BRINGING THE CATCH HOME.

THE DAY'S WORK IS OVER.

Readers' Hints, Tips and Gadgets

DARKENING AN ORDINARY ROOM.

THE blocking out of light in a room only occasionally used as a dark-room appears to be a great difficulty with many amateurs. Each window, of course, presents its own individual problems, because the shape of the frames and the available space round the window may set limits to the possibilities, but the simple arrangement I have used is at least adaptable to most. It may not be new, but it solved the problem for me.

First, I obtained a piece of the cheapest oilcloth I could find, and had it cut so as to cover the window completely and to fill up practically all the available space round it. At each corner I made a diagonal slit as shown in the accompanying sketch.

Into the woodwork at the corners of the window I then screwed four ordinary screw-eyes, these being placed so that they came about two inches inside the edge of the oilcloth. The oilcloth was then put into place so that the slits came over the screw-eyes, which were then turned from their original position, parallel with the slits, into that shown in the sketch.

This, I found, held the oilcloth in position fairly well, but a better and more light-tight job was made by obtaining some curtain-springs from the local sixpenny store and stretching them rather tightly along the four sides, as shown. Still more complete exclusion of light can be obtained by glueing plush or felt along the edges of the oilcloth, so that all cracks between it and the window-frame are filled up.

One of the particular advantages of this method of excluding light is that the oilcloth can be put up or taken down in a few

seconds, and except for the screw-eyes the room in ordinary use shows no signs of being convertible into a dark-room.

A. A. SMITH.

PRINTING FROM PAPER NEGATIVES.

PAPER films have been on the market for some time, but the ordinary amateur has no means of printing from them. Special apparatus, too expensive to buy except for the professional printer who is likely to make many hundreds of prints with its aid, is really required.

The printer is, in effect, only an ordinary episcopo, in which a lens projects an image of the brilliantly-illuminated negative. For the usual purpose of giving a show of projected prints, an episcopo is difficult to make solely on the grounds

that it is difficult to get enough illumination to project a picture brilliant enough to be enjoyable to look at. But for printing, brilliance does not really matter; a dim image will print just as well as a bright one provided that sufficient exposure is given. For this purpose, therefore, quite a simple arrangement will serve, and there is no need to have hundreds of watts of light nor a projection-lens of terrific aperture.

The sketch shows, in principle only, the arrangements necessary for making prints, same size or enlarged, by projection from a paper negative. The latter, upside-down for preference, is pinned to the hinged back of the box or lantern shown, and is illuminated by one or more 100-watt lamps. A lens mounted at the right distance (this should be variable for focussing unless one single size of print is deemed enough) throws an image of the negative on to an easel or printing-frame that carries the bromide paper, the image, if the lens is fixed, being focussed by moving the easel back and forth as may be necessary.

Details and dimensions of the lantern are not given; any photographer who is mechanic enough to make up this apparatus for himself will be able to design his own to suit whatever lens he has available. A preliminary experiment, best made by putting a light behind a glass or film negative, or even a postcard with a hole in it, will soon show at what distance from the negative the lens should be to give an image of the required size.

G. W. PRINGLE.

MAKING SURE OF THE TWELFTH PICTURE.

MANY Rolleiflex users have no doubt been disappointed that the twelfth picture is sometimes cut down when the film is developed. This may happen when using Kodak film, and many come to the conclusion that this film is shorter than other makes.

The explanation lies in the fact that the circumference of the Kodak empty spool is greater by about 1/12th of an inch than an Agfa empty spool. When a film is automatically wound on to a Kodak spool the divisions between the pictures are greater than when a spool of lesser circumference is used; i.e., more of the film is used up in the divisions so that there is not enough space for the last picture on the film.

The remedy lies in using an Agfa empty spool to take up the winding of the full spool, or to use a few spare Kodak spools

that have had the circumference reduced through sandpapering the wooden core.

The Reflex for Easy Focussing

is the Zeiss Ikon Ikonflex for 12 pictures $2\frac{1}{4} \times 2\frac{1}{4}$ " on the usual $3\frac{1}{4} \times 2\frac{1}{4}$ " spool. A special feature of the Ikonflex is the focussing screen, consisting of a plano-convex lens ground on the under side, which ensures a brilliantly illuminated picture, even at the corners, with which to focus. Our illustration shows at the top the large magnifier for fine focussing, mounted above the focussing screen. On the left can be seen the back-sight of the direct-vision view-finder, which is also incorporated in the finder hood, and underneath is the automatic picture numbering device for either wood or metal spools. The front plate bearing the camera lens—either Zeiss Tessar or Triotar f/3.5, or Novar f/4.5—and the finder lens is also shown.

Compur Rapid to 1/500th sec., or Compur normal to 1/300th sec., and Derval or Klio shutters are the shutter equipment supplied with the Ikonflex. Prices from £15 12s. 6d. with Zeiss lenses, or from £7 with Zeiss Ikon anastigmats and shutters.

IKOFLEX

You can read all about the Ikonflex in our 32-page illustrated book "Pictures of our Daily Lives," free on request.

All Ikonflex cameras fitted with Compur shutters sold in Great Britain or Ireland at current listed prices carry the three-year guarantee. Ask your dealer for particulars.

"MINIATURE" NOTES

Short articles, illustrations, hints and tips, formulæ, reviews, queries and replies dealing with Miniature Camera work will appear under this heading every week.

Sports Photography

By HAROLD BURDEKIN.

BUN-AND-TREACLE RACE.
1/50th at f/5.6. Dull day.

DURING the summer months many opportunities for photographing sporting events of all kinds present themselves to the owners of miniature cameras. It does not matter where one lives, for in the village, town, or seaside resort, sports of some type are bound to take place during periods of the summer months. Archery, Bowls, Cricket, Tennis, Golf, Polo, Athletic Sports, Swimming, Diving, Regattas and Water Sports are some of the subjects which make good pictures.

As in all forms of photography there is a wrong and right way to depict

sporting activities. It is important to remember at the outset that sport of all kinds depends on action, and for successful pictures the action should be shown, or at least suggested, in the picture. I have found that the miniature camera is an excellent instrument for photographing sports. The wide-aperture lens enables one to work at fast shutter-speeds, and the direct-vision view-finder is most helpful in this kind

JUMPING THE TENNIS NET. 1/200th at f/4. Diffused sun.

AT A POINT-TO-POINT. 1/1,000th at f/2. Bright sunshine.

of work as it enables you to follow the action and snap the picture at the critical moment.

Another great advantage of the miniature camera is that the ordinary lens can be replaced by a long-focus lens in a matter of a few seconds. In a cricket match, for instance, the normal-focus lens renders the figures far too small, but with a long focal-length lens you can obtain some good action pictures of a bowler or batsman. At a regatta, too, it is an easy matter to stand on the shore and fill up the picture-space on your negative with the long-focus lens. You will not need it, of course, for every sporting event; a great number of interesting pictures can be obtained of many subjects with a lens of normal focal length.

DECK TENNIS. 1/100th at f/4, with pale filter. Bright sun.

PUSH-BALL MATCH. 1/50th at f/5.6. Dull day.

TILTING THE BUCKET. 1/250th sec. at f/4. Diffused sun.

the events which are capable of giving striking pictures.

It is impossible in a short article to give full information as to how to photograph every event, but the accompanying pictures will help to illustrate how action has been shown in each picture. The high jump requires a low camera position to give the impression of height and to make the figure stand out well against the background, which in nine cases out of ten should be the sky. Stand slightly to one side or the other of the high jump, and do not start photographing until towards the end of the jumping, when the bar is at its highest point. During the waiting period you will have had time to watch each com-

petitor and to note the best action. Some jumpers are far more graceful than others. When you have selected the competitor whom you consider the best from the point of view of a pleasing picture, lie flat on the ground and if possible get the bar and the two uprights against the sky. Wait till the jumper is at the highest spot clear of the bar, and snap. It requires a little practice, for a moment too soon or too late spoils the picture.

It should be noted that at the

top of the jump the figure is momentarily stationary, and it does not require such a fast shutter-speed as if one was photographing the upward or downward motions. If one compares the pictures of the girls jumping over the tennis net with the picture of the horse jumping one can see at a glance what I mean. In the first picture the girls are coming directly towards the camera, and have been caught quite sharply at the highest peak with the compara-

tively slow shutter-speed of 1/200th sec. In the other picture the horse flashed right across the camera and needed an exposure of 1/1,000th sec. to arrest movement. Look at the action of the horse and the man's flying coat.

Sports photography is a most interesting pastime, and the miniature camera is the ideal instrument for catching the high-spots of some of the events. One word about films. It is as well to load the camera with a fast panchromatic film. I have found the new Isopan F excellent, as it is of good speed and is pretty well grain-free. This fast film will enable you to cope with all subjects, even on a dull day, if you have an f/2 lens on your miniature camera.

BOXING ON BOARD A LINER. 1/100th sec. at f/4. Bright sun.

A NOTE ON PARALLAX

IN its photographic sense, parallax is generally taken to mean the difference between the field of view included by the finder and that included by the camera itself. If the finder is three inches above the camera, and the two are mounted so that their optical axes are parallel, the finder will include three inches more of the top of the subject, and three inches less of the base, than will the camera. Three inches more or less of a cathedral or a mountain is not of much importance, being negligible in comparison with the total height of the object. But in taking a close-up of a friend we may so arrange the picture that its top margin comes only three inches above the top of his head, in which case the photograph will show his head just touching the edge of the picture-space.

Correcting the Error.

Except by deliberately restricting the angle of view of the finder, so that it will at no time show the exact area of picture that will be obtained on the negative, the only cure for this error is to tip the finder to an extent depending on the distance of the object taken. The amount of tipping required is such as to make the line of sight of the finder cut that of the camera at the position of the object, whereupon the views included by camera and finder embrace the same amount of an object at the one particular distance for which the correction has been made.

The viewpoints of finder and camera, however, remain different, so that although the field of view at one particular distance is the same, objects at different distances which appear to coincide in the finder will not do so in the camera, and vice versa. An illustration of this can be had by holding up one finger before the face, and observing that when

viewed with the two eyes alternately it appears outlined against different parts of the view beyond.

In trying to take a photograph such as that reproduced here, where the whole point lies in so adjusting the position of the camera as to bring the donkey's rein into the hand of the distant figure, no view-finder, no matter whether it has a parallax correction or not, can be relied upon. If, as is usual, the finder is above the camera lens, it will show the rein somewhere between hand and elbow of the distant figure when the camera would register it as shown here. Alternatively, if the rein came exactly into the hand in the finder, it would appear above it in the finished photograph, taken from a lower viewpoint.

Overcoming Parallax.

Since parallax-correction is useless except for objects at one fixed distance, how are photographs of this sort taken? The answer lies in the use of a single-lens reflex, where the lens giving the finder image also takes the photograph. Or a camera fitted with a focussing screen allowing direct inspection of the camera-image could be used. If a twin-lens reflex or a camera fitted with a view-finder has to be employed, the exact position for the lens is found by moving the camera about until the view seen in the finder is exactly what is required, after which the camera is raised until the taking lens occupies the position of the finder lens.

A subject where parallax would need to be avoided.

Modern Miniature Cameras

THE NEW SIX-20 DUO KODAK.

THIS is a new model of the Six-20 Duo Kodak, which is a small and portable camera making 16 exposures 4.5×6 cm. in size on a standard 620 film designed for 8 exposures in the $3\frac{1}{2} \times 2\frac{1}{2}$ size. The use of 620 film, which is wound on a metal-cored spool, enables the dimensions of the camera, and particularly its thickness, to be kept below the average for cameras taking this size of picture. The camera measures $5 \times 3\frac{1}{2} \times 1\frac{1}{2}$ in. over all projections, and its weight, when loaded, is 21 oz.

As the illustration shows, the camera is horizontal in design, the baseboard being hinged to one of the long sides of the camera body. Owing to the fact that the picture is taken across the film, this design allows the baseboard to be longer than if the camera opened in the more usual way.

The camera is of the semi-self-erecting type, opening on pressure of a button but requiring a gentle pressure on the baseboard to lock the lens front finally into place. The lens fitted is a fast anastigmat of aperture $f/4.5$ or $f/3.5$, fitted in a Compur shutter, except in

the least expensive model, which has a Kodak shutter speeded $1/25$ th to $1/125$ th second with delayed-action release. In this new model the shutter release is operated through a system of levers from a knob on the camera body, enabling the instrument to be held firmly and comfortably in both hands at eye-level.

This new feature should enable even the comparatively inexperienced to obtain negatives at quite slow shutter speeds without camera shake.

Focussing is performed in the conventional manner by rotation of the front cell of the lens, this being clearly marked with a scale graduated to $\frac{1}{3}$ feet. The front of the camera is unlocked for closing by pressure on a thumb-plate on the front of the baseboard, thus allowing the front to be unlocked and the camera closed in a single movement. The view-finder is of the folding direct-vision optical type, and is of size adequate for comfortable viewing of the subject. The revolving depth-of-focus scale which was fitted to earlier models of this camera is retained, and shows in very graphic form the depth of focus obtained at any aperture, with the camera focussed for any distance marked on the scale. The winding-knob, on the opposite side of the camera, is of flat disc form, thereby maintaining the compactness of the instrument as a whole. A shoe is provided on the top of the camera, into which those who find focussing difficult may slip a Kodak pocket range-finder.

Loading is carried out in the usual manner, the film-chambers being so designed that insertion of the spools is easy and convenient. The lock holding the camera-back closed is of new design, requiring to be lifted up before the camera can be opened. It is therefore quite impossible for the camera to be opened or even unlocked except with deliberate intent. The two red windows controlling the advance of the film are fitted with a sliding cover to ensure that the fastest panchromatic film can be used without danger of fog.

The camera, which is covered with black leather, has all its metal fittings finished in matt chromium plate. With an $f/4.5$ Kodak lens in the 4-speed Kodak shutter described, the new Six-20 Duo Kodak costs £7 10s. Either this or an $f/3.5$ Kodak lens may be had in conjunction with a Compur shutter, while with an $f/3.5$ Tessar in Compur shutter the price is £13 10s. Further particulars of this camera, which is available from any dealer, may be had on application from Messrs. Kodak Ltd., Kingsway, W.C.2.

Miniature Camera Gossip

By LANCELOT VINING.

I HAVE been spending a few days in Cornwall, and while there I amused myself trying out the $7\frac{1}{2}$ -in. $f/6.3$ Tele-Tessar. I was anxious to find out what is the longest focus that can be used in the hand with unipod support without fear of movement, and from the past week's results I think 7 in. will prove to be about the limit. In their hand-book, Messrs. Zeiss say, "The Tele-Tessar is the first of a series of lenses which give too great a magnification to be used with camera in the hand."

As I was at the sea and had nothing but the best of light, I was able to work at $1/200$ th at $f/11$. This week, if I can find the time, I want to extend my tests and see what the results will be at

A ROMP IN THE SEA. Taken with $7\frac{1}{2}$ -in. lens, $1/200$ th at $f/11$, from 300 feet away.

Home Again.

My flash-gun has returned from its long journey to and from New York, and Messrs. Mendelsohn have fitted it with their latest improvement, which makes it possible to work direct on to the Con tax focal-plane shutter, instead of having to use a front-lens shutter limited

to $1/200$ th. In addition I shall be able to use lenses of various focal lengths, which ought to prove very useful.

So far I have only had time to make one or two trial exposures to check synchronisation, which I find perfect. I hope to give it a real test at the London Casino's show and publish one of the results next week.

Nothing Doing.

A reader who has been in Paris writes to ask me if I obtained any pictures of the illuminations on the Seine, and what about publishing some of the results.

ILLUMINATED FOUNTAIN, PLACE DE LA CONCORDE.
2-in. lens, $f/1.5$, $1/25$ th sec., Agfa I.S.S.

slow speeds and whether it is possible to get results at $1/10$ th.

This lens works in conjunction with the range-finder, and I found that the yellow rectangle used when focussing is just about the size of the picture obtained, so that when working on moving objects it was possible to use this and not have to take the eye from the small finder to the Universal above.

I did not obtain any pictures, as although when I was there the Exhibition had been open a month, there were no illuminations worth a penny film either on the Seine or in the grounds during the few days that I was there. So I had to be satisfied with the fountains in the Place de la Concorde. These, brilliantly illuminated at night, make a very attractive sight quite easy to photograph.

TEN GUINEAS AND UNDER

A Section for the User of the
Inexpensive Miniature.

A Londoner's Lido By A. L. M. S.

A SWALLOW DIVE. 1/175th sec., f/4.5, Isochrom F film.

THE many open-air swimming-pools round about London offer the Londoner a chance of some sun-bathing and swimming if the weather is propitious. Most of these pools are modelled on the Continental type of resort, a style fast becoming popular in this country too, and they offer, besides the swimming-pool itself, an expanse of space for sun-bathing and, usually, a restaurant where meals can be had without the trouble of changing back into street clothes.

For the photographer, especially if his camera is an inconspicuous little miniature, these lidos for the Londoner offer considerable attraction. Incident of every kind is there in plenty, if only he can be quick enough to catch it, while divers, swimmers, and users of the chute present subjects at every moment of the day.

The photographs accompanying these notes were all taken during one visit to the Roehampton swimming pool, the camera

used being a Baldi 3×4 cm. miniature with an f/4.5 lens in a Prontor shutter. The maximum speed of this is only 1/175th second, which is hardly fast enough to yield a sharp image of a diver when moving at his fastest. But by exposing just after the diver leaves the board, as in "A Swallow Dive," and keeping the figure a little on the small

TEA-TIME. 1/50th sec., f/8, Isochrom F film.

side, a sufficiently sharp image is easily obtained. Exposing early in the dive has the further advantage that the diver is then seen against the sky instead of being muddled up with a spotty background.

The chute provides a subject for a fast shutter, too, as well as an exercise in timing exposure. In "Down the Chute" the timing is about right, but a faster shutter speed would have been an advantage, as the figure is not quite sharp. In "Splash!"

another photograph like the preceding one was aimed at, but the release was pressed a fraction of a second too late.

Meal-times provide their incidents, too, but "Tea-time" is really another failure. The girl was trying to get a sparrow to eat out of her hand, but he fluttered back behind the tea-cup just at the critical moment, and was gone before I could make a second exposure.

DOWN THE CHUTE. 1/175th sec., f/4.5, Isochrom F film.

SPLASH! 1/175th sec., f/4.5, Isochrom F film.

Miniature Matters

A selection of readers' queries that deal with "miniature" photography will be answered here every week.

A RED FILTER.

I have recently purchased a red filter for my miniature, and have had very disappointing results. It does not seem to render skies any more strongly than quite a pale yellow filter. The film I use is a medium-speed panchromatic; is this the wrong kind of film for a red filter? E. H. D. G. (Essex.)

There is nothing wrong with your choice of film; in fact, a panchromatic film is essential when using a red filter. The only explanation we can think of for your failure to get stronger skies is that you have been using the filter for cases to which it is not applicable. A red filter should darken down a blue sky tremendously, and so give very strong cloud effects indeed, but it will not help in the least in bringing up the clouds if the whole sky is cloudy. In such a case it becomes a question, not of differentiating white from blue, but of differentiating various tones of grey, and for this no colour-filter can possibly be of assistance.

SLOW ENLARGING.

Can you tell me whether you would regard the enclosed miniature negatives as of normal density? I find great difficulty in enlarging them; the light does not appear to be nearly strong enough, although it is adequate for negatives from a V.P. camera which I also possess. A. T. (Potter's Bar.)

The negatives you send are very fully exposed, and, in consequence, are rather dense. Your letter suggests that you are not using a miniature enlarger, and, therefore, when you enlarge from these small negatives you are using only a very small proportion of the total light available. This, combined with the density of the negatives, will tend to make exposures extremely long.

You do not mention whether you use an exposure meter or not, but if you do we should suggest that you reckon the film as being double the speed that you have hitherto taken as correct. (Double an H. & D. number; add 3 to a Scheiner figure, or the numerator of a DIN rating). The decreased exposures resulting will still be quite long enough, and the negatives you get will be easier to enlarge.

FEWER EXPOSURES.

Can you tell me if I can obtain films that will fit my Double-8 camera and give less than 16 exposures to the spool? C. H. A. (Middlesbrough.)

Six-exposure spools for V.P. cameras, which in your camera would give 12 exposures, are offered by all the leading makers. In some cases only medium speed ortho film can be had, but one firm at least offers film of all types in this size. The code number by which you order these six-exposure films is 21. Since the Double-8 camera is built for the standard 8-exposure V.P. film, we cannot guarantee that the 6-exposure film will fit it satisfactorily; for this you will have to consult the makers, Messrs. Ensign, Ltd., 88, High Holborn, W.C.1.

A MATTER OF COMPROMISE.

Can you give me the developer formula for finest grain? There must be no increase in exposure time. H. B. (Birmingham.)

No developer exists which will give grain as fine as the finest obtainable and yet require no increase in exposure time. Plain paraphenylene-diamine gives the finest grain, but requires an increase of exposure up to six times. No extra exposure is required by D76, but the grain is by no means the finest. Between these two extremes there are compromises, such as the Sease III formula, Meritol, buffered borax (the original formula, not D76d), Champlin 15, and so on. You will have to choose your own from among these to get whatever compromise you desire between exposure and fineness of grain.

SPEED OF COLOUR FILM.

Can you give me the speed of the new 35-mm. Agfa-color film for use with the Weston exposure meter Model 650? P. M. C. (Perth.)

We have no reference to the numbers used on the Weston exposure meter of the particular pattern you use, but you can arrive at the desired result by comparison with another film by remembering that the new Agfacolor film is rated by its makers at 7/10ths DIN. It should therefore be given exactly ten times the exposure that would be required by the Agfa Isopan film of speed 17/10ths DIN, or any other film of the same speed.

SUMMER LIGHTNING

By GEORGE SWAIN.

Hot-weather thunderstorms provide quite good subjects for the camera, and this article shows how even a beginner may make successful lightning pictures with quite simple apparatus.

ONE of the traditional jokes about the English weather tells us that the summer we get in this country consists of two fine days and a thunderstorm. During the two fine days, of course, the camera is sure to be busy, but it is not everyone to whom it would occur that the subsequent thunderstorm may also offer an opportunity for making striking pictures.

"As quick as lightning" is so common a phrase that the uninitiated might well be forgiven for wondering whether a camera fitted with a shutter of which the fastest speed is a mere hundredth of a second would be of any use for photographing a lightning-flash. The old hand knows that an attempt to snapshot lightning is very unlikely to succeed, for the flash comes without warning, and is over before the photographer can release his shutter.

Set the Shutter to "Time."

Lightning at night is easy to take with even the simplest camera. The method is to open the shutter, point the camera in the direction from which a flash is likely, and wait for it. When the flash is over, the shutter is closed. During the waiting period no image is impressed on the

Fig. 2. Taken less than a minute after Fig. 1, this flash struck barely fifty yards from the first.

Fig. 1. This flash, which struck some houses only 150 yards from the camera, was taken at $f/3.5$.

film because there is no light to speak of; the length of the effective exposure is the duration of the flash.

If a flash of "sheet lightning" occurs, illuminating the landscape by reflection without there being an actual flash within the field of view of the camera, the film can be regarded as spoilt, and should be wound on before opening the shutter again.

Even a Box Camera will do.

The aperture used does not make much difference to the result so far as the flash itself is concerned; this is bright enough to register satisfactorily even when using the slow lens of a box camera. But a faster lens is an advantage, because it gives a better chance of obtaining an image of the house-tops or trees illuminated by the flash or silhouetted against the lighted sky.

A point to notice is that a flash of lightning very often consists of a whole series of successive flashes along the same path. These follow one another so rapidly that to the eye the whole series appears as one instantaneous flash, but if the camera should be moved, deliberately or accidentally, during the short time the series lasts, the negative may show several parallel flashes, each an exact replica of the others. Movement insufficient to separate the flashes may result simply in a blurred image; the camera should therefore be supported or steadied in some way.

For the two photographs reproduced on this page, the camera was held in the hand, steadiness being obtained by resting the elbows on the edge of an upstairs window. Both flashes reached the ground within 200 yards of the photographer, one of them—Fig. 1—doing some damage to the roofs and chimneys of houses it struck.

It is not every photographer who is lucky enough to find himself so close to the point where a flash strikes, but quite effective lightning pictures can be obtained whenever the storm is not too far away.

SERIES

By
J. P. MUNN.

PHOTOGRAPHS

A PART from pictorial landscape work, I think children and animals form by far the most interesting subjects for the camera. Many will assert that they rank first, and certainly their varied expressions, their childish tricks and whims, and their unselfconsciously expressive poses, if recorded in a natural way, are always a source of enjoyment to all.

If of one's own children the more precious these prints obviously become, especially as time goes on, but no matter how we may cherish such individual efforts, a series of four, six or eight pictures is infinitely better. And there is no scarcity of subject matter, either, although a certain amount of thought and consideration is necessary prior to exposing.

The kiddies themselves will furnish ideas for many little pictorial episodes if studied while at play, and it may be that a series can be obtained with little effort. In the main, however,

specially clear and detailed pictures will probably be left in the mind; these are the outstanding ones that should actually be reproduced by photographing your model.

The series reproduced here is fairly complete; there are enough pictures to tell the story, but quite a number more could be added if desired. The eager boy asking his mother for the necessary penny, next opening the garden gate with the penny firmly

NO. 1. "HERE HE COMES, MUMMY."

of a simple sub-title to each picture.

In some instances, provided the same clothes are worn, one or more prints could be utilised for different episodes.

An endeavour should also be made, as in all photography, to keep the work as pictorial as possible, and with this in view the background and lighting should be carefully watched.

It is a moot point which is the best type of camera to use, but one almost essential point is a large viewfinder, either of the direct type or reflex. The focussing reflex is undoubtedly advantageous for "close-ups" unless the worker can judge distances accurately.

NO. 3. "IT DOES LOOK GOOD."

after the germination of an idea, the sequence of events to be portrayed should be thought out and an endeavour made to follow this arrangement.

Choice of the best poses or action to illustrate the story may be made by picturing the whole episode as vividly as possible, and in full detail, in the mind's eye. Four or five

NO. 2. A LOVELY FULL ONE.

clutched in his hand, and then rushing down the road excitedly calling "Stop, Stop," to the ice-cream man—these are three more possible stages of the action that might be shown. But on the whole it is usually better to keep the series short.

Do not be niggardly with the exposures, even to twice or even three times the number of prints actually required, as otherwise the very expressions or attitudes most desired may be missed.

It is possible, after development, that our preconceived idea of the story may undergo a change, for the actual expressions recorded may be a better fit to some slightly altered story. There is nothing detrimental in this, however, so long as the final results tell a little human story without words or at most with the help

NO. 4. "AND IT TASTES GOOD, TOO."

how I make my EXHIBITION PICTURES

Methods and Ideals of well-known Pictorial Workers.

No. CCCXCIX.

Mr. A.
GREENWOOD.

From information communicated to our Special Representative.

"I HAVE been interested in photography since my early school-days, my first camera being a box-form quarter-plate magazine type. In those days two or three of us used to club together for a box of plates, and after making the exposures, spent quite an exciting time in a dark cellar developing the results. I never was in the 'button-presser' class, always believing that to get the most out of one's hobby one must do everything oneself, and not in any single instance since taking up photography have I had a negative developed or a print made for me. I by no means regret this course.

"In 1914, when sixteen years of age, I joined the Bradford P.S., and became the proud possessor of my first folding roll-film camera. I think at that time I was the youngest member of the Society, and certainly one of the keenest. Joining a society was certainly the best thing I ever did, and I strongly recommend anyone taking up photography to do the same.

"Up to going to the war in 1916 pictorial photography had little interest to me, my main object being to acquire perfect technique. I lost none of my keenness during the war, however, carrying a V.P.K. most of the time, and having my

copies of 'The A.P.' sent regularly from home. On the few occasions I got home on leave photography was my main occupation, and it certainly took my mind off the war for the time being.

"At the conclusion of hostilities photography came into its own again. Membership of the Society began to increase; I was elected to the Council, and have since been three times President. I took an increased interest in pictorial work, acquired a half-plate camera and began to turn out prints by the carbon process. I then tried various reflex cameras, including the folding type, and began to specialise in street scenes and figure studies. For this class of work I found the quarter-plate reflex ideal.

"From carbon I turned to bromide enlargements and found it was possible to obtain a quality that could not be surpassed by any other process. Whenever possible I favour a straight print, preferring to use every care at the time of exposure to get just the right viewpoint and lighting, and thus avoid any hand-work on negative or print. On occasions I have to resort to oil reinforcement, but prefer not to do so if it can be avoided.

"My favourite camera to-day is a quarter-plate Soho reflex, with Ross Xpres lens and Dallon telephoto. On occasion I use a Rolleiflex and other miniature cameras of which I fully realise the utility. I still think, however, that the full-size reflex outfit takes a lot of beating for serious work."

(A further example of Mr. A. Greenwood's work is reproduced on one of the centre Art pages.)

MORNING SUNSHINE, CAUDEBEC.

A. Greenwood.

Pictures in the Making

Every week the picture reproduced on the art page opposite will be analysed in detail for the benefit of readers of the paper who are seeking to improve their pictorial work.

"SUNBATHER," by E. Schneider.

THERE is a spontaneity and freshness about this picture which, together with its directness and simplicity of statement, makes it a most attractive piece of work. These special qualities, I think, are attributable entirely to the fact that it is an out of door portrait, and, although it may be a matter of opinion, I do not feel that any product of a studio could bring them out to the same degree.

The worker in the studio may have certain advantages. His lighting and setting are wholly under control; he can alter his viewpoint as he wishes, and time, as a rule, is not of very much moment. He is, however, handicapped by a lack of power in the lighting, and the surroundings are scarcely such as to inspire a sense of freedom in the sitter or to impose an impression of spontaneity. But, even if he should be able to induce a perfectly spontaneous expression in his subjects, the chances are that he would find it impossible to get it on account of the length of the exposure necessitated by the weakness of the indoor illumination.

A spontaneous expression is a very transitory thing. Its essence lies in its animation, and, of its nature, it almost always has to be anticipated. The shortest exposure that is generally practicable under ordinary studio conditions is in the neighbourhood of a quarter of a second, and, while this was elapsing, it is very probable not only that the expression would change but that movement of the features would cause a blurring of the image, while, as for anticipation, it scarcely seems a feasible proposition.

Out of doors presents an entirely different state of affairs. With the figure in full sunshine, such as in this instance, an exposure of 1/25th of a second is well within the range of practical politics, and this is short enough to "stop" anything but the

most rapid change of expression. It would permit the exercise of what power of anticipation we might possess, and, with the confidence born of knowledge of the fact, we could make our exposure with the reasonable certainty of securing the utmost measure of spontaneity.

The atmosphere out of doors, too, is quite a different thing to the con-

dition of a studio. Instead of inculcating a feeling of restraint, a sense of freedom is impelled both by the surroundings and the dress, as well as by the fact that the model is surrounded by friends, of whom, no doubt, the photographer is one. Everything tends towards naturalness, and, in such circumstances, the advantages in favour of outdoor portraiture, from this particular aspect, are overwhelming.

With sunshine for the lighting, however, its arrangement calls for not a little management. Its direction cannot be altered at will—as is the case in a studio—and it is the position of the model that has to be considered instead.

But when, as in this instance, the direction is favourable, its singleness of source confers an impression of decision in the rendering of the modelling that is unequalled. The drawing is clean cut and well defined. Besides which, the sunshine has the effect of enhancing the expression of animation and life, and so emphasises the suggestion of spontaneity.

It is, nevertheless, another thing to have to watch, and, while catching a momentary expression may not be too easy a task, it is made more complicated by the fact that the effect of the lighting has to be kept in mind as well. Anything in the nature of deliberate posing, unless the model be very experienced and used to the job, is quite out of the question in view of the consequent loss of spontaneity and the possible incursion of camera-consciousness, so that the question resolves itself into a choice of the angle of view and the selection of the right moment for making the exposure.

How that is decided upon is a matter for one's own ingenuity. Experience usually evolves a technique in the method of working that eventually becomes familiar and gets the results desired, but it is sometimes feasible, among a small circle of intimates, to arrange the preliminaries of posing and lighting with the co-operation of the sitter, and, after they have been completed, to start a round of conversation with the idea of catching the subject as soon as it is absorbed by someone else and its attention is elsewhere.

I rather feel that the subject of our discussion was produced upon lines akin to these, but, even if it were not, it is a manner of working that I know does bring successful results, and, during the present holiday season, the adoption of a similar method may be tried.

PICTURES by Novices

SOME CRITICAL COMMENTS on the Beginners' prints reproduced on the opposite page

BEFORE proceeding to discuss the prints reproduced on the opposite page, I would like to refer to the picture "Sunbather," by E. Schneider, which has been reviewed on another page in my article under the heading of "Pictures in the Making." This effort is by an experienced worker and might be taken as an example of the goal for which the makers of these little prints are striving.

Example and Precept.

In my remarks, I indicated a method of working by which a similar result might be obtained, and these, as far as applicable, may be read in conjunction with what I have to say about the prints on the opposite page; but, having regard to the quality of the work, there was naturally no occasion to refer to those minor aspects of technique which are more or less automatic to the worker of experience.

The beginner—in photography as in most other things—wants to run before he can walk. He wants to turn out a thing like "Sunbather" before he is certain of such things as exposure times, the degree of development to which his negatives should be carried, the technique of making quality prints, or the manipulative details of correct focussing; the avoidance of camera-shake and subject movement; the choice and arrangement of his material and its setting, and its proper placing in the picture space.

And it can't be done. I would not wish to be discouraging, and need scarcely add that, in describing the disabilities which I notice, I do so only with the object of enabling them to be avoided and not with any suspicion of malice; but it is no use blinking the fact that the usual run of prints reproduced on the Beginners' page—good as they may be in their class—do not come anywhere near the standard of the others shown on our centre pages, not because their aim is lower, but simply because their technique is not up to the job.

The Means and the End.

To take Nos. 5 and 9, "Portrait," by W. Beck, and R. T. Pickett's "Portrait" as examples. They bear a superficial resemblance to "Sun-

bather" inasmuch as they both show a large-scale head against the sky, but the harmony of tone in the latter is replaced in No. 5 by an inclination towards excessive vigour and the impression is magnified by the inclusion of that stretch of dark in the setting.

Let that dark be taken away and a softer kind of paper substituted and a good deal of the disability under which the print is labouring would be removed. But it would also be advisable for the model to be turned so that her face got more of the light, and for the patterned dress she is wearing to be changed for one that is appreciably lighter in tone and of an even neutral tint.

Turning the model, however, involves a change in the point of view—that is, if the same aspect of the features is desired—and it may be that with the alteration in the line of sight the placing of the subject against the setting might be improved, but this, of course, is a point that could only be determined on the spot.

Camera-Consciousness.

That there is no visible appearance of camera-consciousness is a good point, and, as far as the judgment of the focussing distance is concerned, it does not seem to be much out; but, with No. 9, there is a lack of decision in the features that might be due either to movement of the subject, shake of the camera, or incorrect focussing.

Which could only definitely be indicated after a scrutiny of the negative under a magnifier. The cause would, however, indicate the steps to be taken to avoid a recurrence, and, as with No. 5, a more frontal lighting would afford better modelling in the features. It would, in this case also, diminish some of the contrast between the figure and the setting, and if, at the same time, that contrast could be further reduced by the choice of a somewhat softer grade of printing paper, all the better.

The setting, nevertheless, does show points of advantage over No. 5, for it is commendably plain and quite without the disfiguring features to which reference has previously been made.

The head is rather too low in the picture space to be comfortable, and would seem much better placed, I think, if half an inch were trimmed from the top.

Outdoor and Indoor.

No. 1, "Joy," by John R. Wallis, is another outdoor effort, and though the little figure is quite well caught and the expression jolly and captivating, the print needs to be scrutinised pretty closely before the fact is seen.

Here, the setting and lighting are badly managed. The first is practically as strong in its contrasts as the face of the child, whose profile, therefore, is scarcely to be seen against it. The head, too, is turned away from the light and this does not help the least little bit, while the line of the far bank, sitting down on the head as it does, creates a most undesirable impression.

The other child portrait, No. 6, "Michael," by M. Brown, is considerably better designed as far as the relationship of figure and background is concerned. The light of the head is quite well displayed against a dark portion of the setting and pose and expression are good and characteristic of a child of that age. I should, however, have preferred that the setting, if no lighter in tone, were more even and less assertive, and would like to see a less plucky rendering.

Judgment in Focussing.

The focussing seems to be correctly judged, and, turning to the indoor efforts, where there is little excuse for any mistake in this direction, I find that something seems to have gone wrong with No. 7, "June," by E. J. Thomas, for neither features nor dress are properly defined.

It rather looks as though the lens had been extended too far, and none of the subject is in focus. Nos. 3 and 4, "Portrait," by A. F. Lovell, and "Ann Veronica," by N. A. Siggers, are better in this respect, but, in both cases, it seems as though the sitters had become thoroughly weary of the proceedings and show it in their expressions. Which all goes to show the wisdom of getting things ready beforehand and being "on the job" as soon as the model appears.

"MENTOR."

With the Beginners

NOTES AND NOTIONS FOR THE
LESS ADVANCED WORKER

Every week an article will appear under this heading dealing with a topic of interest to the novice in photography.

PHOTOGRAPHY AT THE FAIR.

ABOUT a mile away, on the edge of Epping Forest, is a clearing that has been occupied on Bank Holidays, as long as I can remember, by a "fair"—swings, steam roundabouts, coco-nut shies and all the usual "fun." As it was years since I had collected any photographs here I thought I would try an hour's shooting, and strolled over for the purpose.

Fig. 1.

It was a surprise not to hear the usual blare of the steam organs from afar; there was instead a sort of continuous sound not unlike that of the sea on a long stretch of shore, which I found was the result of hordes of people eating and drinking. The centre and focus of the whole show was not a fair but a public house, and the density of the crowd was in direct ratio to the strength of the smell of beer.

The fair had vanished except for the half-dozen swing boats shown in Fig. 1. I photographed them in the old-fashioned way, catching some of the boats well up in the air. That is how we were told to do it. The proper way now is to stand nearly under one of the boats, point the camera up and chance the result.

Fig. 4 shows the inadequate remains of the catering section. But there were certainly other sources of supply; for scattered thickly over the face of the earth, in an incredible litter of paper and rubbish, and kicked and trampled on by moving crowds, were hundreds of people "con-

Fig. 2.

suming" beer, ices, shrimps, oranges, jellied eels, toffee apples and any mortal thing that can be gnawed, licked, chewed, sucked or swallowed. This was the fun of the fair.

Close at hand was what I knew for years as one of the numerous forest ponds. Some of these are very attractive. They are the breeding-ground of mosquitoes, which even the dragon-flies cannot keep down; but they are a pleasant feature of a lovely forest.

To provide post-war work this particular pond was enlarged, cleaned out and clay-lined to make a Peter Pan boating lake, and I preferred this to the crowds who were too suggestive of maggots in cheese. The small corner shown in Fig. 2 gives an idea of the congested navigation, and the noise of constant collisions can be heard even above

Fig. 3.

Fig. 4.

the sound of eating and drinking. These little boating subjects are often available, and are quite easy to take even with the simplest of cameras. About $1/25$ th of a second at $f/8$ or $f/11$ will do it.

Fig. 3 suggests that the pond is gradually reverting to its natural beauty. I did several of this sort right against the light. This requires proper shielding of the lens against direct sun rays, and a longer exposure must be given to get some detail in the deep shadows. Movement precludes any slower exposure than $1/25$ th of a second, so

Fig. 5.

that the only course is to open up the lens to $f/6.3$ or larger. It is also necessary in such cases to cut down development time a bit, that is, if the negatives can be given individual treatment.

On the other hand, an open subject like Fig. 5 permits of a stop of about $f/11$, and the trees can be kept dark to show up the figures. If a really good version of such a subject as this is required, the best plan is to make several exposures at intervals, as the arrangement of figures is constantly altering, and some are bound to be better than others.

As in addition to boating there was paddling, model yacht sailing, and even fishing, I am afraid I should not have used the word "pond." It should be Lido. Sorry. But are fairs dying out? W. L. F. W.

Filters and Miniature Photography ^{By} "COMPUR."

IT is nowadays almost impossible for the earnest photographer to derive the fullest satisfaction from his picture-hunting excursions unless he owns at least a small selection of suitable filters. Especially is this the case in miniature photography—where successful enlarging to many diameters is dependent upon the production of finely-graded negatives.

Now, a selection of filters is really necessary, since it is well known that the use of any particular screen is directed by such factors as the kind of light being employed, the nature of the subject matter, the time of the year, the hour of the day and the type of result the amateur is out to secure.

A Useful Selection.

As a basis for individual experiments it may be accepted that some four or five filters (say, pale green, a deeper green, yellow, amber and orange) can with advantage be included in even early equipments. For general guidance, the two former may be used most effectively in early morning and at evening time—more particularly during the early spring and autumn, whilst the others must be more critically used when the sun is higher.

Always, of course, the film in use must be sensitive to the action of colour

screens; and in this respect we are fortunate that the bulk of miniature films are of the pan. and super-pan. varieties.

Care.

Owing to their comparatively small size, miniature camera filters occasionally suffer badly from neglectful handling. There is ever a strong temptation to slip them into the waistcoat or even the trousers pockets—and some have been finally traced to the motorist's "cubby-hole."

As the filters are made with soft glass, the risk of scratching that accompanies such treatment is easily understood, nor is it difficult to imagine how dust and dirt similarly attach themselves to the accessories. A lessening of the real intensity of the light, the "scattering" of incidental rays and a reduction of the sharpness or clarity of image are only three of the deleterious effects of scratches, dust and surface dirt.

Most firms, of course, provide suitable cases for all their miniature-camera filters. Undoubtedly, the most efficient devices are the velvet-lined, metal boxes similar to those which accompany all filters supplied for use with the Kodak "Retina"; these are neither dirt-accumulating nor large—the cased filter taking up little more room than when unprotected.

All the undesirable effects referred to above can also be acquired through carelessness in using the filters—soiling by means of the fingers and thumbs, in putting them on the lens, being by no means uncommon in operation. The correct method of attaching any filter consists in opening the case so that the filter itself can fall easily into a "cup" created by the two first fingers and the thumb of the right hand. In this way, only the metal flange or mount makes contact with the fingers—so that the attachment can be effected quickly and without risk of soiling the filter glass.

After Use.

Much of the foregoing advice applies equally to replacing any filter after use or during a change-over, since a chance opportunity may call for a hasty adjustment that leaves no time for examining the filter.

At all times, too, it is essential to keep the filter cases free from dust and grit. This cannot always be done by periodical cleaning alone, as working by the seaside or in dusty squalls may contaminate both filters and cases in a few seconds. For this reason the screens should be taken from the cases and attached as quickly as possible, care being taken to close the cases again immediately.

MAKING BETTER SNAPSHOTS-11

By DAVID CHARLES.

This article is the eleventh of a series which is dealing, week by week, with matters of interest to the camera-user who is anxious to do full justice to his subjects.

Fig. 1. A stranded boat may be a picture, or it may not. Here it is too much confused with its surroundings.

A BOAT left stranded on the foreshore is a subject at which the beginner with a camera is very apt to take immediate aim without very much consideration as to whether the view of it which chance has brought him is, or is not, likely to make the best picture of it.

It is one of the main purposes of this series of articles to show that some little prospecting for a better viewpoint will often discover a variety of entirely different effects. The value of this present example is not affected by the fact that the stranded boat was photographed, not at the seaside at all, but in the far more cramped conditions of a London suburb by the River Thames. At the sea there is not likely to be an iron bridge immediately behind the boat. But there may be other discordant details which will as surely obscure its sweeping outlines. These lines are the features which, consciously or subconsciously, constitute the appeal of this type of subject. Therefore it is desirable to seek for a viewpoint which gives a suitable background. Such a background will be simple in character, so as to make the lines of the boat stand out.

A Matter of Viewpoint.

By approaching nearer the water's edge, enough space was found between the boat and the uprights of the bridge to enable the latter to be kept entirely out of the picture, as in Fig. 2, and at the same time to secure a more sweeping angle to the boat's lines. From this aspect, too, the curiously-shaped anchor helps to fill the otherwise empty foreground, while the mooring-rope also

Fig. 2. The interesting foreground lends distance to a better outlined boat. With the bridge trimmed off, far nicer than Fig. 1.

Fig. 3. Beware of a near foreground object which will dwarf the main subject.

assists in giving a natural sense of perspective and relief. I have purposely left the portion of the bridge at the top of the print, to show how this exposure was made. A still closer approach would have exaggerated the size of the anchor too much, and it would then have looked stupidly big for a boat which then would have appeared still smaller by contrast. Trimming off the bridge from the top of the print will complete this effort.

Relative Sizes.

This necessity for care in using a foreground object which will be necessarily exaggerated in size by its nearness to the camera is plainly seen from the other side of the same boat, making an attempt to use its dinghy in similar fashion (Fig. 3). The dinghy looks larger than its mother boat! But, having noted this for future guidance, the ever-roving eye of the alert photographer is sure to catch sight of that pool of water in which the boat is partially reflected. Closer examination of this reflection discovers the opportunity for an entirely different picture, that of Fig. 4. By stooping with the camera, the height of the boat is apparently increased; by raising it the pool with its reflection is broadened—giving useful practice in deciding when a satisfactory compromise has been obtained.

Fig. 5 from the same subject is scarcely a picture, in the "exhibition" sense of the word. But it is just the kind of study in lines and masses which forms useful practice for those to make who aspire later on to see their pictures reproduced on the art pages of this journal.

Fig. 4. A reflection in a pool forms a nice exercise in composing the picture, as well as in holding a camera steady at any desired level.

Fig. 5. Making simple studies of "lines and masses" is useful practice for the aspirant to art.

LET ALL MEN KNOW

that we, counting ourselves as being among those who may truly, and with no inward qualms of conscience, style themselves "specialists," we, we repeat, are of all experts most expert in those many and varied matters appertaining to that most wonderful branch of modern science pithily but aptly designated "miniature photography." We say this quite plainly, and with no attempt at gasconading—we admit that good wine needs no bush but, continuing adage-*io*, were we too diligently to hide our light neath a bushel then you, the gracious (certainly) and good (we hope) miniaturists of these Blessed Isles would lose the finest service available for you.

Therefore do we not delay, nor brook of any, in climbing to the housetops to proclaim the fact that we, as specialists, are unsurpassed. Our part-exchange allowances deserve more than that cold and unrevealing adjective "generous," and our hire purchase arrangements are tactful. We account it just as great a pleasure to supply on hire purchase as otherwise, since 'tis the miniaturist we serve, and not his arrangements for settling his own private affairs. We look forward with pleasure to hearing from you. "Try 202 for Service!"

SPECIAL OFFER

We have now in stock three only Compass Cameras which we are obliged to sell as second-hand owing to their having previously been issued, but which are to all intents and purposes brand new, since we have only just received them back from the manufacturers, who have altered them to conform to the specification of the very latest model. The price of the cameras is £19 10s., and as we do not anticipate having them in stock for any length of time, prospective Compass users are advised to get in touch with us at once in order to discuss straight away the exchange of their present miniature apparatus and, if required, the hire purchase arrangements.

MISCELLANEOUS CAMERAS—contd.:

Kodak Six-20 Duo, f/3.5 Kodak lens, Compur £7 17 6
Dolly Super Sport, f/2.8 Xenar, 3 slides and focussing screen £9 17 6
520 Ikonta, f/3.5 Tessar, Rapid Compur, case. As new £9 17 6
Voigtlander Virtus, f/3.5 Heliar, case. Excellent condition £8 17 6
V.P. Weeny-Ultrix, f/2 Xenon. As new £12 10 0

CAMERAS TAKING 16 on V.P. FILM:

Zeiss Kolibri, f/3.5 Tessar, Compur. Good condition £6 17 6
Plaubel Makinette, f/2.7 Anticomar. Good condition £10 17 6
Voigtlander Perkeo, f/3.5 Skopar, Compur. Good condition £5 15 0
Picochic, f/2.9 Vidanar, Compur. Good condition £4 7 6
Pupille, f/2 Xenon, Compur. Excellent condition £13 17 6
Reflex Attachment for the Pupille. New condition £2 5 0

THE ONLY CAMERA OF ITS CLASS!

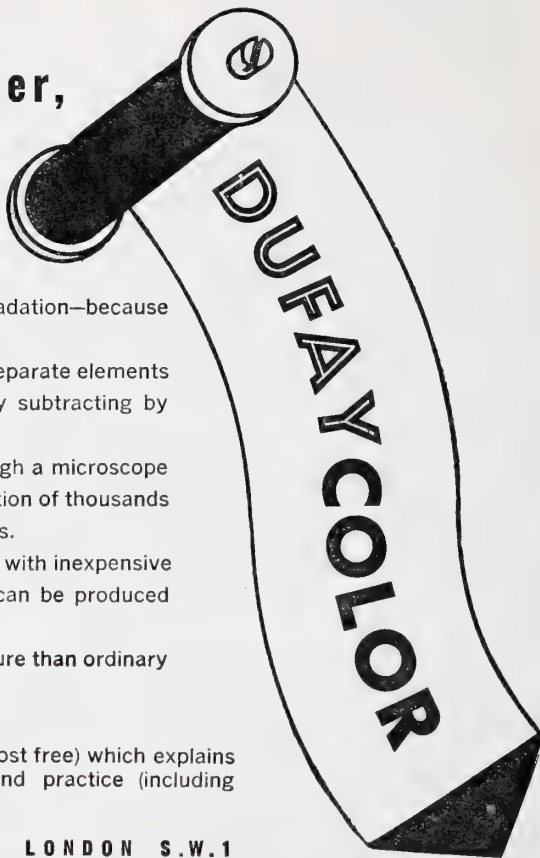

The Kine-Exakta has the distinction of being the only true reflex camera taking solely 35-mm. film; its distinction, however, does not end there! We have not seen any true reflex camera giving such a brilliant screen image before, and it is also a novelty to have a screen image showing a picture twice the actual negative size. The whole specification of the camera is more than one would have thought possible at the price asked; here is just a selection of its beauties: Takes all standard 36-exposure films. Extra magnifier fitted to hood. Interchangeable lenses, in bayonet mounts. Focussing from 3 feet. Lenses interchangeable with film loaded in camera. Automatic film wind and shutter setting. Picture counter. Automatic shutter lock. Special film cutter, to enable the user to use fewer than 36 exposures. The prices asked for this camera are as follows:

Fitted F/3.5 Exaktar..... £27 10 0
F/3.5 Tessar..... £34 10 0
F/2.8 Tessar..... £38 10 0
F/1.9 Primoplan..... £45 0 0

The 'additive' process means truer, more brilliant COLOUR

Dufaycolor gives you brilliant results without filters; exquisite gradation—because it is based upon the "additive" process.

In other words, the colour tones are obtained by **adding together** separate elements of the primary colours (red, blue, and green), rather than by subtracting by means of filter layers.

Every colour is alive! Look at a Dufaycolor transparency through a microscope and you will see that its brilliant tints, its subtle hues, are an addition of thousands of elements of red, blue, and green light, in varying proportions.

Dufaycolor is a **fast** film permitting action snapshots in full colour with inexpensive lenses. Duplicate transparencies, and black-and-white prints, can be produced in any quantity.

Put Dufaycolor in your camera. It costs but little more per picture than ordinary film, and it is made in every size. Buy a roll today!

THE DUFAYCOLOR BOOK

Please write for a copy of this book (price 8d post free) which explains precisely and non-technically the theory and practice (including processing and finishing) of Dufaycolor.

ROBOT

"THE CAMERA THAT THINKS FOR YOU"

and just a few of the many reasons WHY!

- Shoots sequence pictures at machine-gun speed.
- Film winds itself automatically and sets shutter.
- Takes up to 50 exposures on standard 35-mm. film.
- No double or overlapping exposures possible.
- Dual cassette loading permits removal of any part of film at any time.
- Incorporates filter which compensates exposure.
- Shutter gives Time from 1 sec. to 1/500th sec. and all intermediate speeds.
- Lens always in "Ready" position—no time wasted in withdrawing mount. Etc., Etc.

**FULLEST DETAILS GLADLY
SENT ON REQUEST TO:**

SUBJECTS at your Garden Gate

By
D. SWAINE.

RECENTLY I undertook to test a new camera for a friend, and in casting about for subject-matter for the test I found myself wondering why I had never previously thought of the photographic possibilities of our daily callers at the house door.

For the business in hand I selected Saturday morning, usually a busy day for tradesmen, and within an hour had secured these illustrations, which I think easily prove what a wonderful collection could be made if such a pleasant task were to be tackled in a more leisurely fashion. Among younger amateur photographers there is bound to be a certain shyness when first dealing with people, so that such a series would be ideal as an introduction to this class of work, for one's models will, generally speaking, be well known, friendly, and anxious to oblige.

Natural Poses.

Such lack of constraint leads to easy poses and expressions, so that even where a single-figure study is being arranged the effect will be quite natural.

ICE-CREAM MEN.

Exposure 1/50th sec. at f/4.5.

all that is desired. And many houses I know have two milkmen to serve them and perhaps more than one greengrocer.

The Background Difficulty.

Probably the greatest difficulty in making a number of figure studies in a street lies in dealing with the background. This will usually be made up of garden walls, railings, isolated trees and other

THE GREENGROCER ARRIVES.

Exposure 1/50th sec. at f/4.5.

houses. The first step is therefore to try and arrange the lighting on the figure in such a manner that, with the help of differential focussing, it will stand as clear as possible from any unharmonious pattern there may be behind it.

Use Panchromatic Film.

Panchromatic film is necessary, because of the deep red-brown complexions of most of these hardy outdoor workers who call upon us so regularly and cheerfully in all weathers. Also, with the white-coated ones there may be a chance of placing them against the blue sky and using a light filter to bring out the beautiful effect of sunshine.

In spite of the large lens opening necessary for differential focussing it will not be found that the shutter speed need be high except in the case of a white-coated figure. Even on a day of brilliant sunshine a dark object close to the camera will require 1/50th at f/4.5 on fast panchromatic film.

Since, for the sake of isolating the figures, they will have been placed against a contrasting background, it is important

THE WINDOW-CLEANER.

Exposure 1/10th sec. at f/8.

to notice that development must not be carried too far, or the resulting negatives will be so hard that printing, and more especially enlarging, will be difficult.

If a street is particularly unfortunate as regards background it is a good plan to arrange one's figures—if the light is suitable—so that they are viewed against the roadway as it fades into infinity. This often removes the difficulty of spots and patches due to contrasty objects, completely out of focus, behind the figures which are the subject of the picture.

In spite of all the clever photography which is indulged in with a ball of wool or a couple of tumblers as subject matter, human interest is still the greatest force in the picture world, and a collection of prints along the lines suggested will prove a permanent source of pleasure in portfolio or album.

"LEND ME THE KEYS."

Exposure 1/50th sec. at f/3.5.

Amateur Cinematography

Filming the Fun of the Fair By NORMAN DYER.

ROUNABOUTS, coco-nut shies, helter-skelters, and "all you ring you 'ave!" What a chance for the amateur cinematographer! Yes, and what a chance to waste film unless you form some pretty definite plans in your mind before you start. There is usually so much happening that shooting here, there, and everywhere at whatever looks like a good thing invariably results in a hotch-potch of scenes in which nothing stands out.

A Pictorial Introduction.

A shot of the crowd entering the fair, with perhaps a few close-ups of amusing or interesting contrasts, such as the oldest and youngest pleasure-seekers and the most elaborate and the simplest conveyance, will make a good lead up. Then once inside the fair ground be sparing with your film, and keep on the look-out for little incidents which can be shot and inserted later on as relief-spots in the finished film. A kiddie sucking an enormous stick of rock or a man carrying an armful of coco-nuts—he may be only the proprietor of the shy, but a sub-title can easily suggest that he is a visitor whose luck was in—will help to put light and shade into the picture.

Next the roundabouts. A fairly close shot of one taken just as it starts up, so that the movement is not sufficiently rapid to make a blur. Then take a ride on the roundabout and film the fair as you go round; but get a corner of the roundabout (the head of one of the horses and its brass supporting rod, for instance) into the picture, or it will only look like an amateurishly fast "pan." If the light is good enough on the roundabout, you might try a shot directly behind you at some of the other passengers.

Reversed Action.

Then the coco-nut shy or the hoop-là stand. Film a few attempts by customers, and then, choosing a moment when there are plenty of rings on the stand or plenty of balls lying on the ground by the coco-nuts, take a shot with the camera upside-down. Spliced in right way round it will give you a comic effect of the hoops or balls being energetically returned to the spectators by the things they have been throwing at. And isn't it marvellous how unerringly the spectators catch them every time!

Now for a very special attempt. Take a ticket on the scenic railway or switch-back or toboggan or whatever the most thrilling attraction may be, and see that you have a new reel of film in the camera because you won't have time to reload. Settle yourself firmly in a front seat, get your friend to hang on to you, and proceed to film some of the more exciting

runs down precipitous slopes and round dizzy corners. Of course, you will get swung about, and the camera will probably take a few wild dives on its own now and then. But if you invest a whole twenty-five foot length of film on this one attraction you will have as thrilling a set of shots as the most excitement-loving fan could desire.

Then after the ride take a shot of the cars starting, and another of them finishing. If you can get someone to pose for you in a picturesque state of collapse it will make a good silent comment on the thrills just filmed.

Down the Water-chute.

The water-chute will be an easier subject, and both for this and the scenic railway you can, if you wish, fix your camera on a tripod and adjust it to point fairly down the track so that you need not keep your eye glued to the view-finder. But it may get jolted out of place, so take care. A reverse shot of the water-chute boat going up instead of coming down hardly needs suggesting, while a close-up of the fortune-teller's booth might be used effectively to introduce some hilarious sub-titles interspersed with odd bits of family film that you happen to have by you.

You might film a hefty young man doing his best to ring the bell on one of those machines which have to be hit with a mallet, and follow it with a picture of a little toddler bravely swinging a tiny hammer. The latter can easily be taken at home against a nondescript background.

More Incongruities.

Film any likely-looking placards advertising living skeletons, bearded ladies and so forth. Spliced together with shots interspersed of members of the family they will get more laughs than the redoubtable Laurel and Hardy, especially if you put stout Aunt Aggie in as the living skeleton and the family terrier as the bearded lady. Here again get your shots against as plain and non-recognisable a background as possible.

If you have with you a friend who is reasonably handy with a gun, take him to the rifle range and get him to smash a few clay pipes. If you pick a range where no prizes are given the targets will be easy to hit. Film him smashing a pipe or two, and then get a shot in reverse motion showing him apparently making a smashed pipe whole with a shot. If you can get a close-up of a puzzled expression on the face of a baby or a puppy that will be fine.

A harbor scene such as this does not need moving people, or even a moving boat, to convey reality. The rippling water and the restless gulls provide all the movement necessary.

Film Interest

By
G. F. HOUFTON.

FILM interest is probably one of the most difficult problems which the amateur cinematographer has to deal with. By this I do not mean that it is very difficult for him to find subjects in plenty that will interest him, but that it is quite another matter to make up a film which will be on the screen probably fifteen to twenty minutes, and will hold the attention of the audience. We are apt to shoot scenes on subjects which attract ourselves, rather forgetting the fact that they may not appeal to other people.

I have seen several amateur films

projected, and have been a member of various audiences, and in most cases the majority of subjects have been those that particularly interest the photographer himself. Personally I always take great pains to photograph subjects that will not only appeal to myself, but will also hold the interest of other people, and I think this is the secret of a successful show.

I have seen many films which have been entirely spoilt by the presence of a shot which obviously should have been cut out when the film was edited. Surely one reel properly finished leaves a much

better impression on the mind of those who see it than do three or four reels indifferently edited, and not possessing any general interest.

On viewing a film recently taken it is often found that it possesses shots which you know do not interest you particularly, but you may discover that they are very much appreciated by other people. We can probably learn a great deal from the still photographer in this respect. Some of the simplest subjects make a very satisfactory picture in still photography, and the same also applies to a moving picture.

The Week's Meetings

Wednesday, August 18th.

North-West London C.C. A Tour of the City of London.

Thursday, August 19th.

Kinning Park Co-op. C.C. Evening Outing to Port Dundas.
North Middx. P.S. "Sicily via Rome."
Oldham P.S. One-Man Show of Prints. F. Hilton.
Stretford C.C. "The Use of a Miniature Camera." C. E. Taylor.

Friday, August 20th.

Folkestone C.C. Club Meeting.

Saturday, August 21st.

Accrington C.C. Wiswell Moor.
Armley and Wortley P.S. Creskeld Lane to Eccup.
Bristol P.S. Stantonbury.
Hackney P.S. Outing to Bayford.
Harrogate P.S. Ripley. Mr. Riley Fortune.
Hull P.S. Partington. L. Kirk.
Kinning Park Co-op. C.C. Doune.
Letchworth C.C. Shephall. H. Meyer.
Liverpool A.P.A. West Kirby and Hills.
Manchester A.P.S. "Alderley." J. Shaw.
Partick C.C. Langbank and Kilmacollm. W. S. Blair.

Societies will have their meetings announced here if the syllabus is sent to us at the beginning of the session or from time to time.

Saturday, August 21st (contd.).

Sheffield P.S. Ford via Eckington. J. A. Lloyd.
Stafford P.S. Newport and Vauxhall. W. A. Lynch.
Stockport P.S. Poynton-Pott Shrigley. E. Hilditch.

Sunday, August 22nd.

Blackpool and Fylde P.S. Bibble Valley. B. D. Taylor.
Hanley P.S. Llangollen. E. L. Glossop.
Hornchurch P.S. The Docks.
Oldham Equitable P.S. Chetham's Hospital. A. E. Petrie.

Monday, August 23rd.

Bournemouth C.C. "The Amateur Photographer" Prints of 1935.
Oldham Equitable P.S. Effective Finish for your Best Print.
Southampton C.C. The Twin-lens Camera. R. T. Bruton.
Stourbridge Inst. P.S. Competition—Optional.

Tuesday, August 24th.

Hackney P.S. "A Set Subject"—Competition.
Leicester and Leicestershire P.S. Exhibition of Pictures.
Manchester A.P.S. The Art of the Mediaeval Wood-carver.
Windsorham C.C. "The Thames." H. Felton.
Worthing C.C. General Meeting for Judging Outing Competition Prints.

Exhibitions and Competitions

CURRENT AND
FUTURE.

The name and address in brackets indicates to whom to apply for further particulars.

The Amateur Photographer Monthly Competitions for Beginners, Intermediate and Advanced Workers.—Entries, August 31. Rules in the issue of July 28.

The Amateur Photographer Novices' Competition.—Special prizes of supplies of films. Latest date for entries, September 30. Particulars in this issue.

Wallace Heaton Competition. Cash prizes every week.—Open to readers of The Amateur Photographer. Full particulars in advertisement page in this issue.

Nuro Competition.—Cash prizes every month. Special prizes for boys and girls under sixteen. Full particulars obtainable from any photographic dealer, or from Nuro Ltd., Biggleswade, Bedfordshire.

Isle of Man Sixth Annual Amateur Photographic Competition, £300 cash prizes. Open until September 30. (P. A. Clague, Publicity Department, Isle of Man.)

"Daily Mirror" "Nushots" Weekly Photographic Competition. Cash prizes. (The Editor, "Daily Mirror," Fetter Lane, London, E.C.4.)

XVIIe Salon Internationale de Photographie de Belgique.—Open, May–October. (M. Julien Lejeune, 70, Av. Van Beelaere, Boitsfort, Brussels.)

Northern Photographic International and Open Exhibition, 1937.—Open, June 19–August 21. (W. Whitehead, 8, Bullrold Drive, Bradford.)

Eighth Chicago International Salon of Photography.—Open, July 15–September 19. (Alex. J. Krupy, Chicago Camera Club, 137, North Wabash Avenue, Chicago, Illinois, U.S.A.)

XXXIe Salon International d'Art Photographique de Paris.—Open, October 2–17. (Le Secrétaire, Société Française de Photographie et de Cinématographie, 51, Rue de Clichy, Paris (9e).)

I International Exhibition of the Photo-Press and Literature (Jugoslavia).—Open, October. (Fotoklub Zagreb, Masarykova II, Zagreb, Jugoslavia.)

Royal Photographic Society of Great Britain, 82nd Annual Exhibition.—Open, September 11–October 9. (The Secretary, Royal Photographic Society, 35, Russell Square, W.C.1.)

46th Toronto Salon of Photography.—Open, August 27–September 11. (W. H. Hammond, 2, Gould Street, Toronto, Canada.)

3e Internationale Focus Fotosalon, Amsterdam, Holland.—Open, September 11–26. (Focus, Ltd., Fotosalon, Bloemendaal, Holland.)

Second Western Ontario Salon of Photography.—Entries, August 25; open, September 13–18. (A. E. Adams, 923, Maitland Street, London, Canada.)

London Salon of Photography.—Entries, September 1; open, September 11–October 9. (The Honorary Secretary, London Salon of Photography, 5a, Pall Mall East, London, S.W.1.)

First International Competition of Artistic Photographic Pictures, 1937.—Entries, September 1, 1937. ("Camera," Messrs. C. J. Bucher, Ltd. (Publishers), Zurichstrasse, 3/5, Lucerne, Switzerland.)

Fifth Annual Salon, Rockville Centre, N.Y.—Entries, September 1; open, September 11–18. (Dr. M. F. Lee, 74, N. Long Beach Road, Rockville Centre, N.Y.)

Anthracite Salon of Photography, Everhart Museum, Scranton, Penna, U.S.A.—Entries, September 7; open, September 18–October 4. (Salon Director, Everhart Museum, Scranton, Penna, U.S.A.)

The Victorian International Salon.—Entries, September 7; open, October 18–30. (C. Stuart Tompkins, The Junction, Camberwell, E.6, Victoria, Australia.)

International Photographic Exhibition, Budapest.—Entries, September 20; open, October. (Modern Magyar Fényképek, VIII, Rákóczi ut 19, Budapest, Hungary.)
